

Linux shell

Connecting to a Unix/Linux system

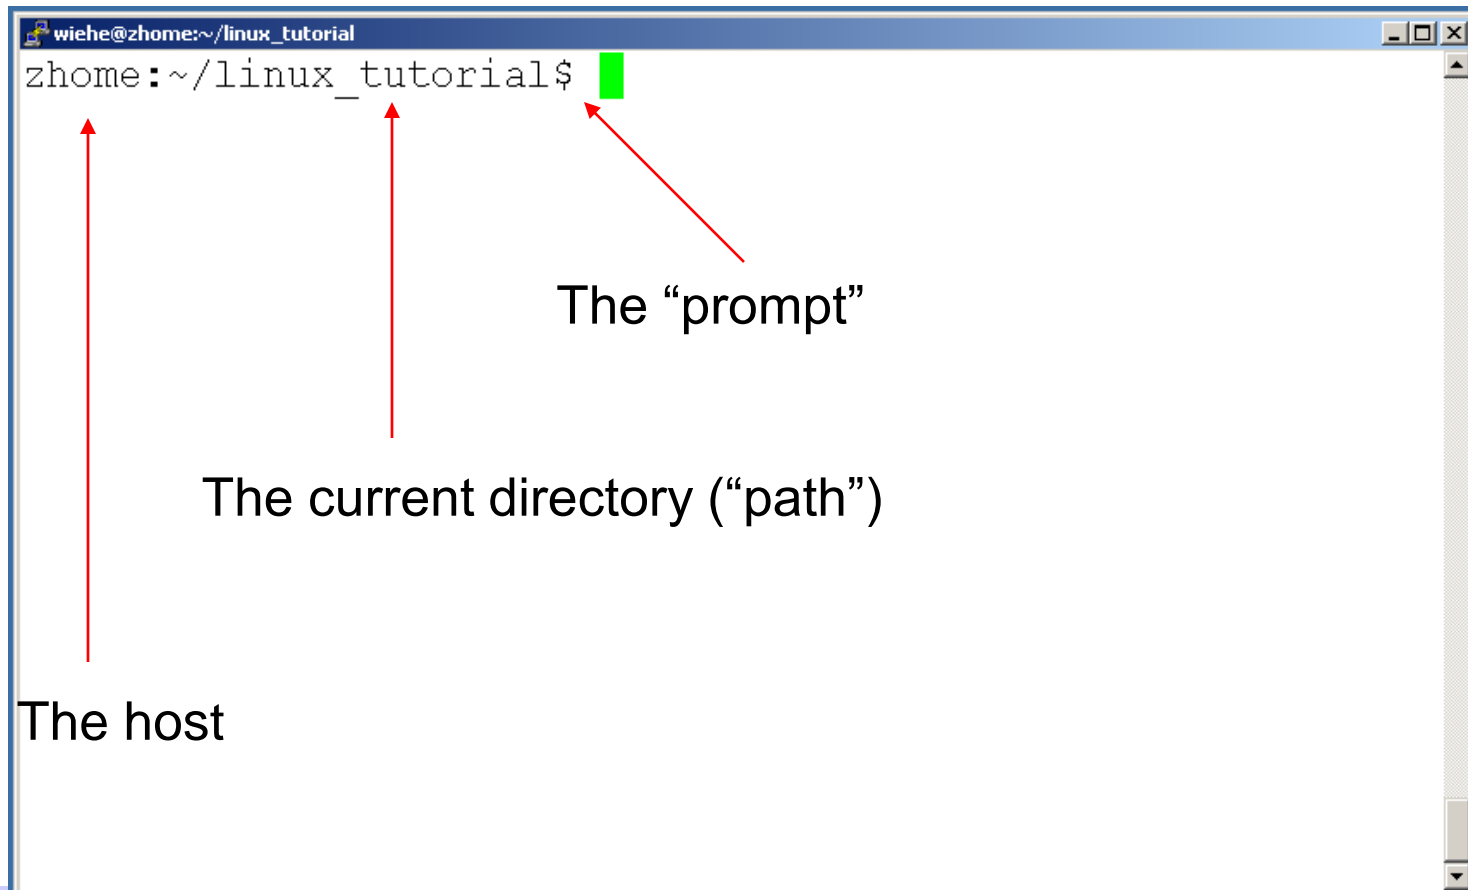

- Open up a terminal:

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$
```

Connecting to a Unix/Linux system

- Open up a terminal:

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$
```

The host

The current directory ("path")

The "prompt"

Detailed description: A terminal window titled 'wiehe@zhome:~/linux_tutorial' is shown. The prompt 'zhome:~/linux_tutorial\$' is displayed. Three red arrows point from text labels to parts of the prompt: 'The host' points to 'zhome', 'The current directory ("path")' points to '~/linux_tutorial', and 'The "prompt"' points to '\$'. A green cursor is positioned after the '\$'.

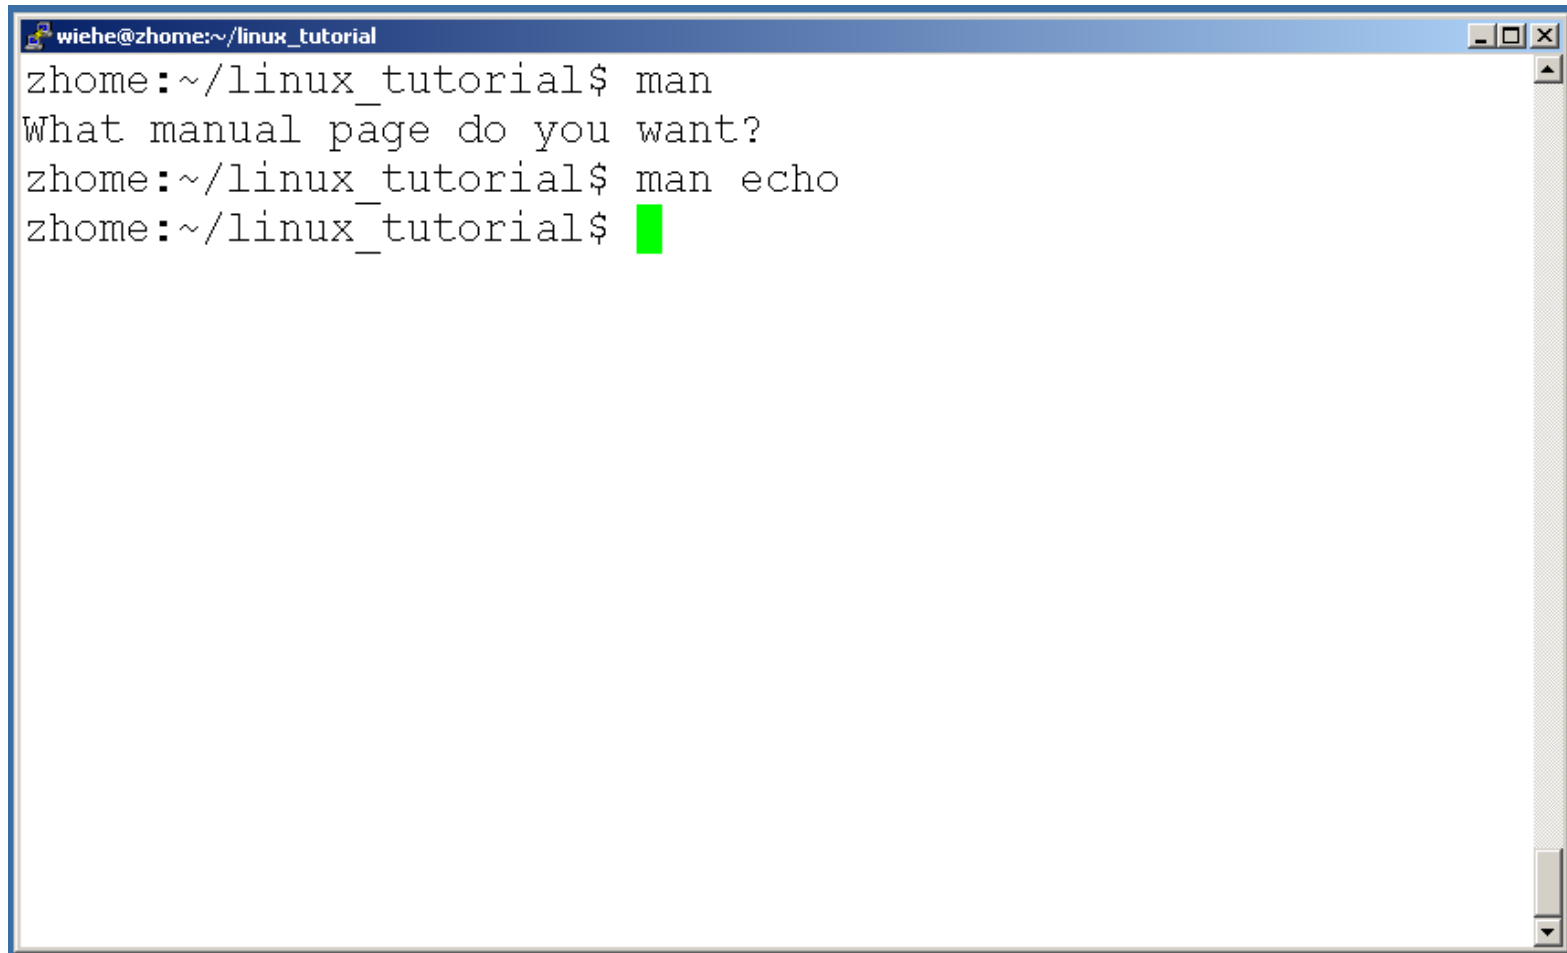

What exactly is a “shell”?

- After logging in, Linux/Unix starts another program called the **shell**
 - The shell interprets commands the user types and manages their execution
 - The shell communicates with the internal part of the operating system called the **kernel**
 - The most popular shells are: tcsh, csh, korn, and bash
 - The differences are most times subtle
 - For this tutorial, we are using bash
 - Shell commands are **CASE SENSITIVE!**
-

Help!

- Whenever you need help with a command type “man” and the command name

Help!

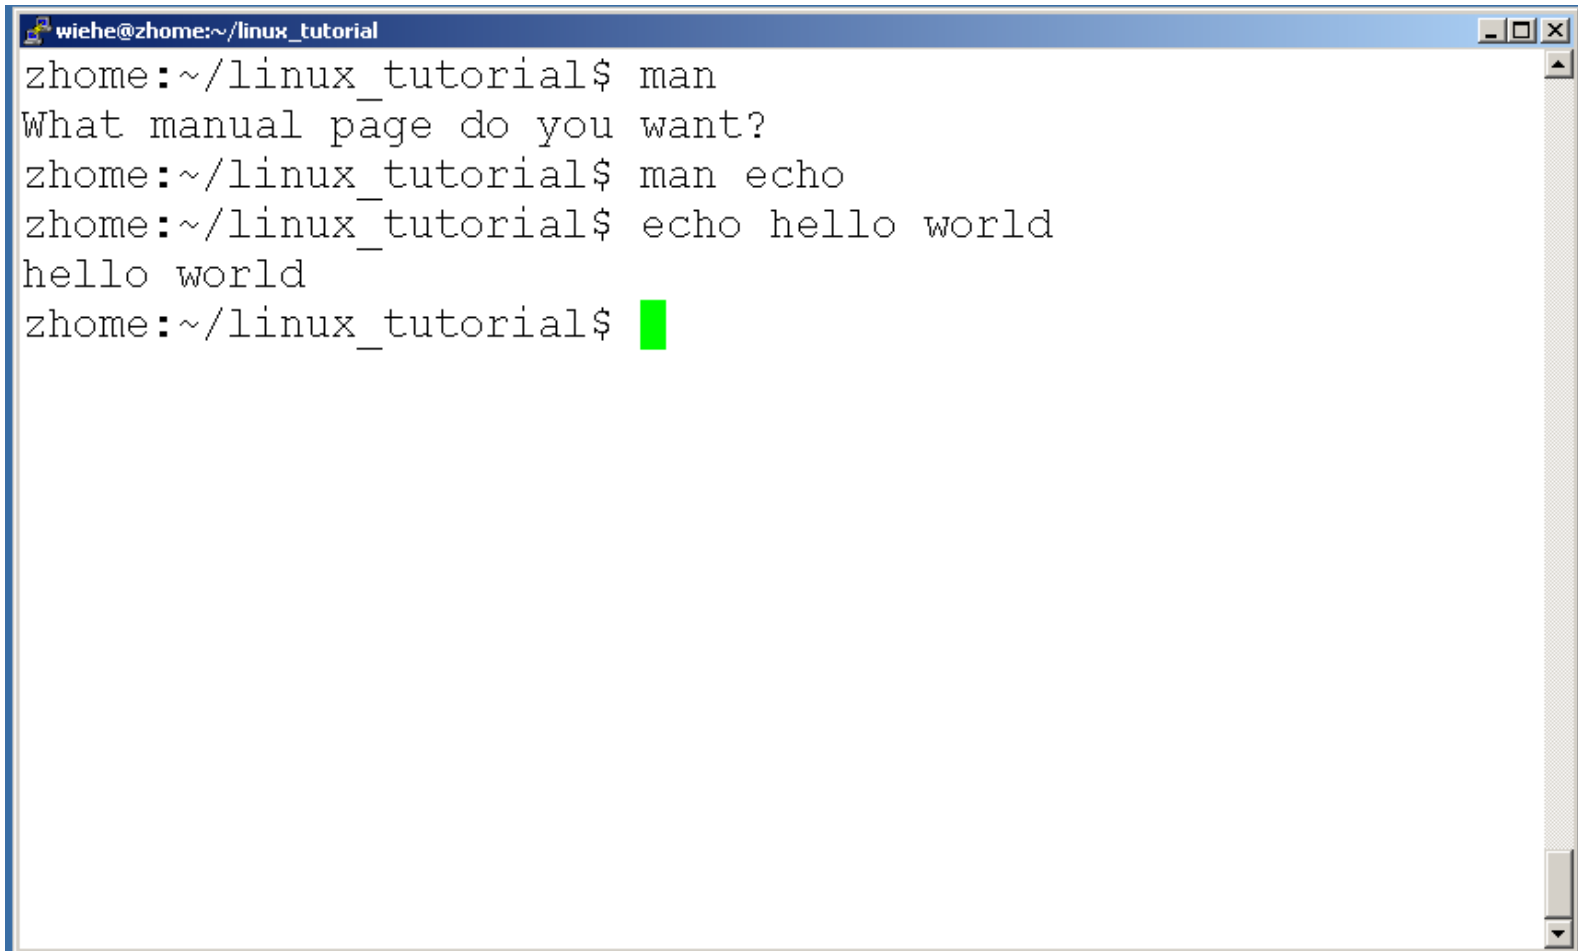

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ man
What manual page do you want?
zhome:~/linux_tutorial$ man echo
zhome:~/linux_tutorial$ █
```

Help!

```
wiehe@zhome:~  
ECHO (1) User Commands ECHO (1)  
  
NAME  
    echo - display a line of text  
  
SYNOPSIS  
    echo [OPTION] ... [STRING] ...  
  
DESCRIPTION  
    NOTE: your shell may have its own version of echo  
    which will supercede the version described here.  
    Please refer to your shell's documentation for  
    details about the options it supports.  
  
    Echo the STRING(s) to standard output.  
  
    -n    do not output the trailing newline  
lines 1-19
```

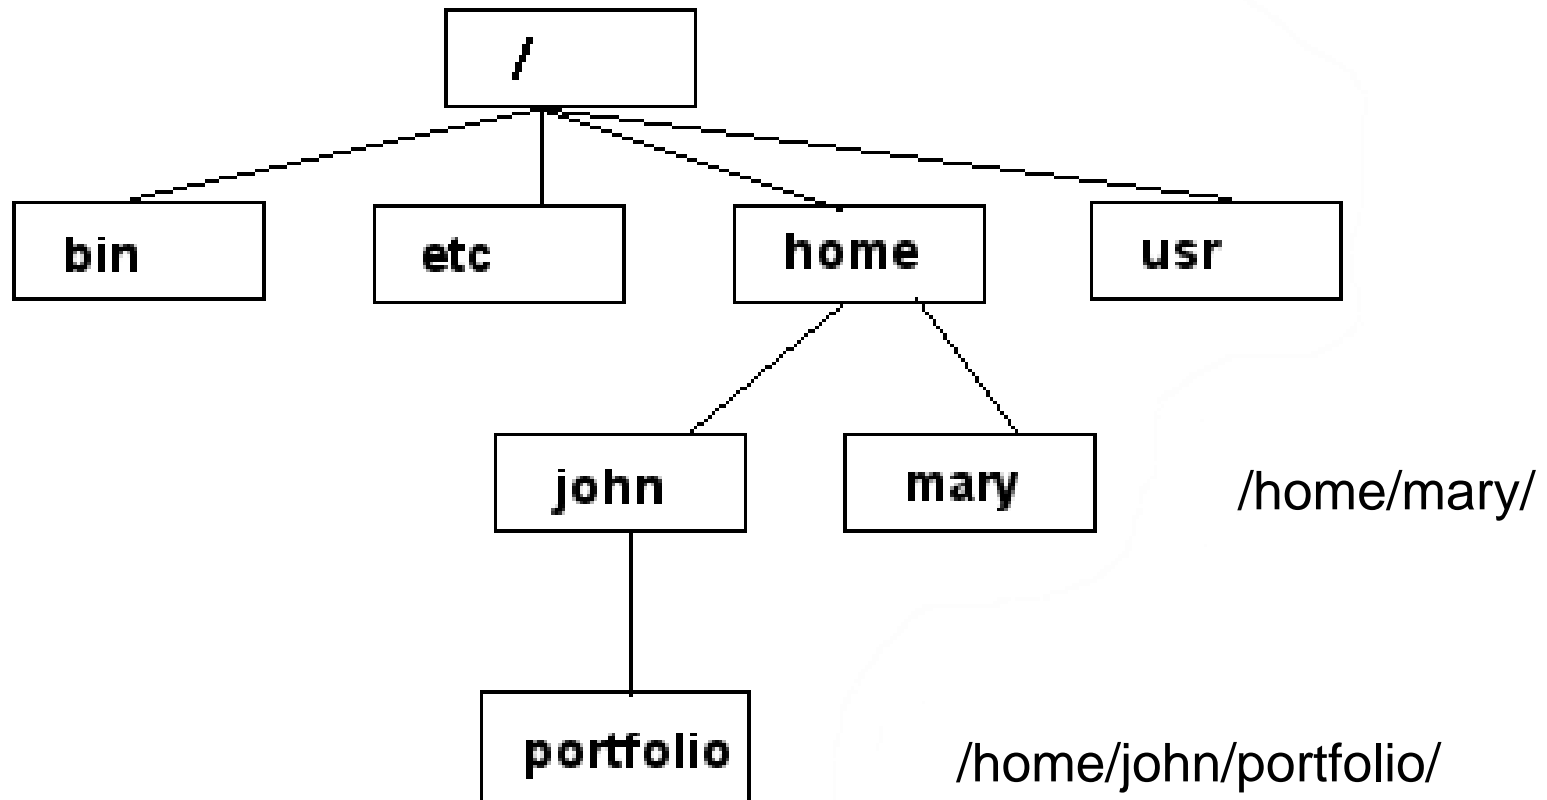

Help!

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ man
What manual page do you want?
zhome:~/linux_tutorial$ man echo
zhome:~/linux_tutorial$ echo hello world
hello world
zhome:~/linux_tutorial$ █
```

Unix/Linux File System

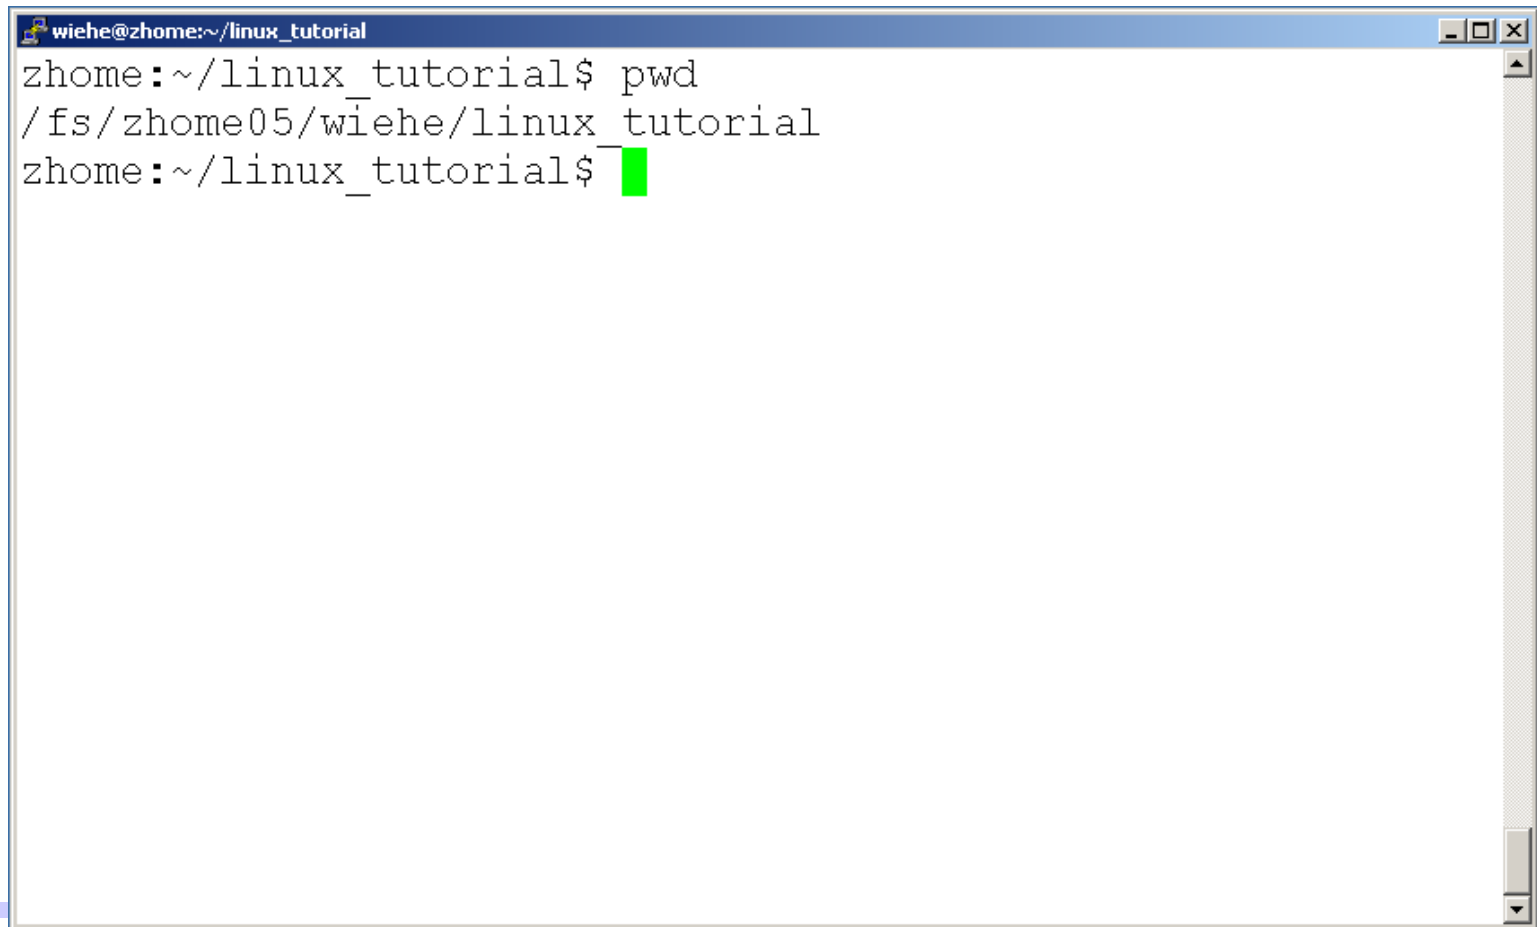

NOTE: Unix file names are **CASE SENSITIVE!**

The Path

Command: pwd

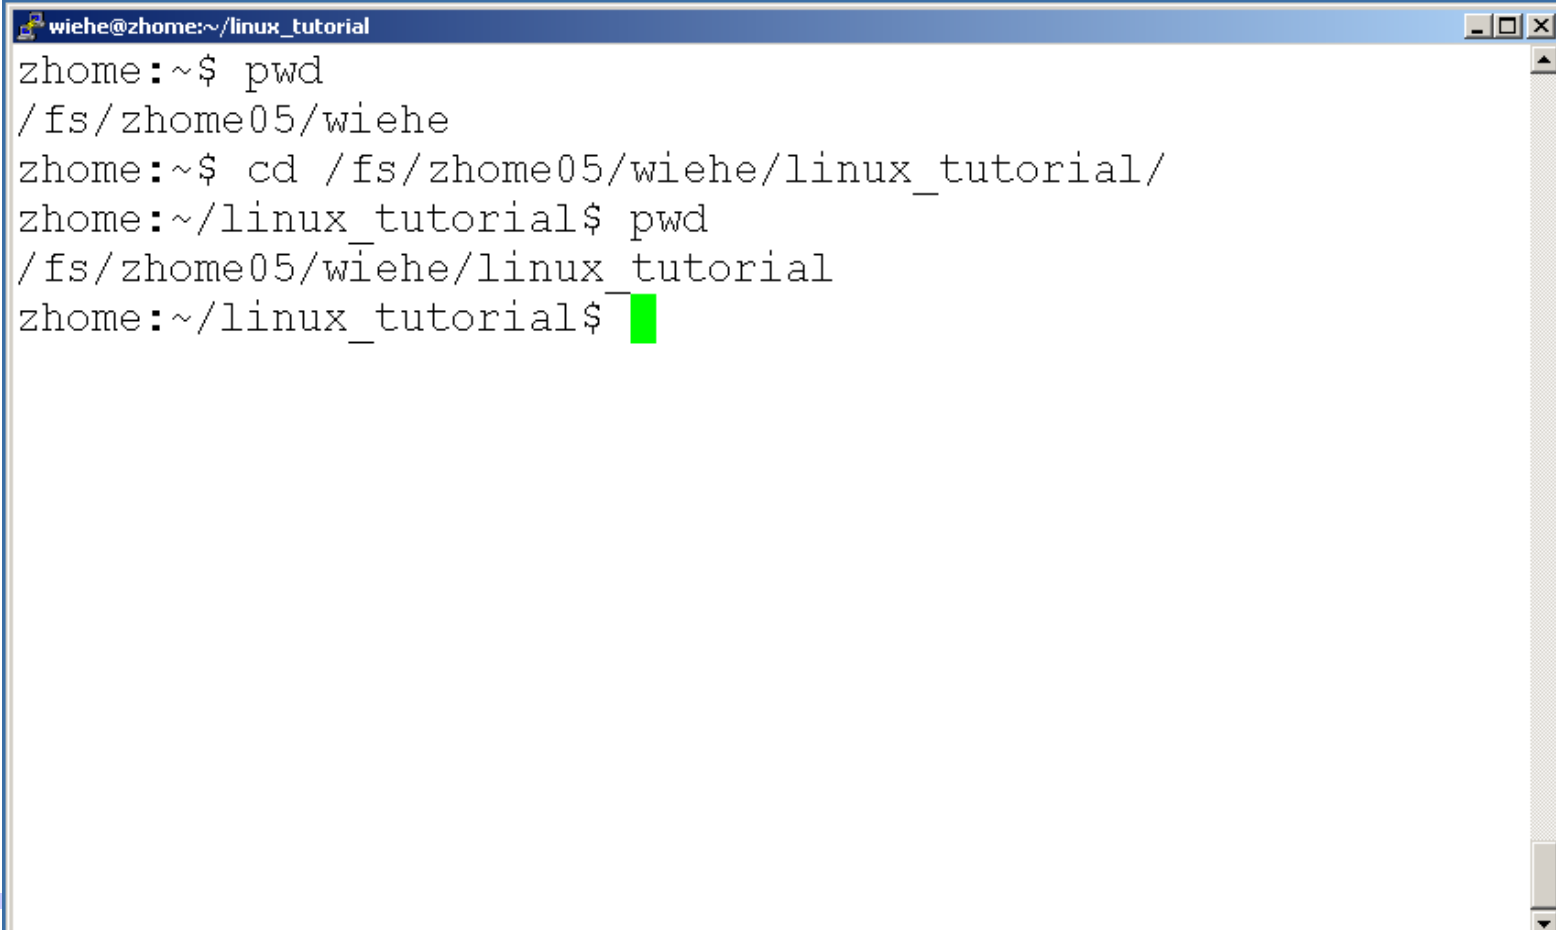

- To find your current path use “pwd”

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ pwd
/fs/zhome05/wiehe/linux_tutorial
zhome:~/linux_tutorial$
```

Command: cd

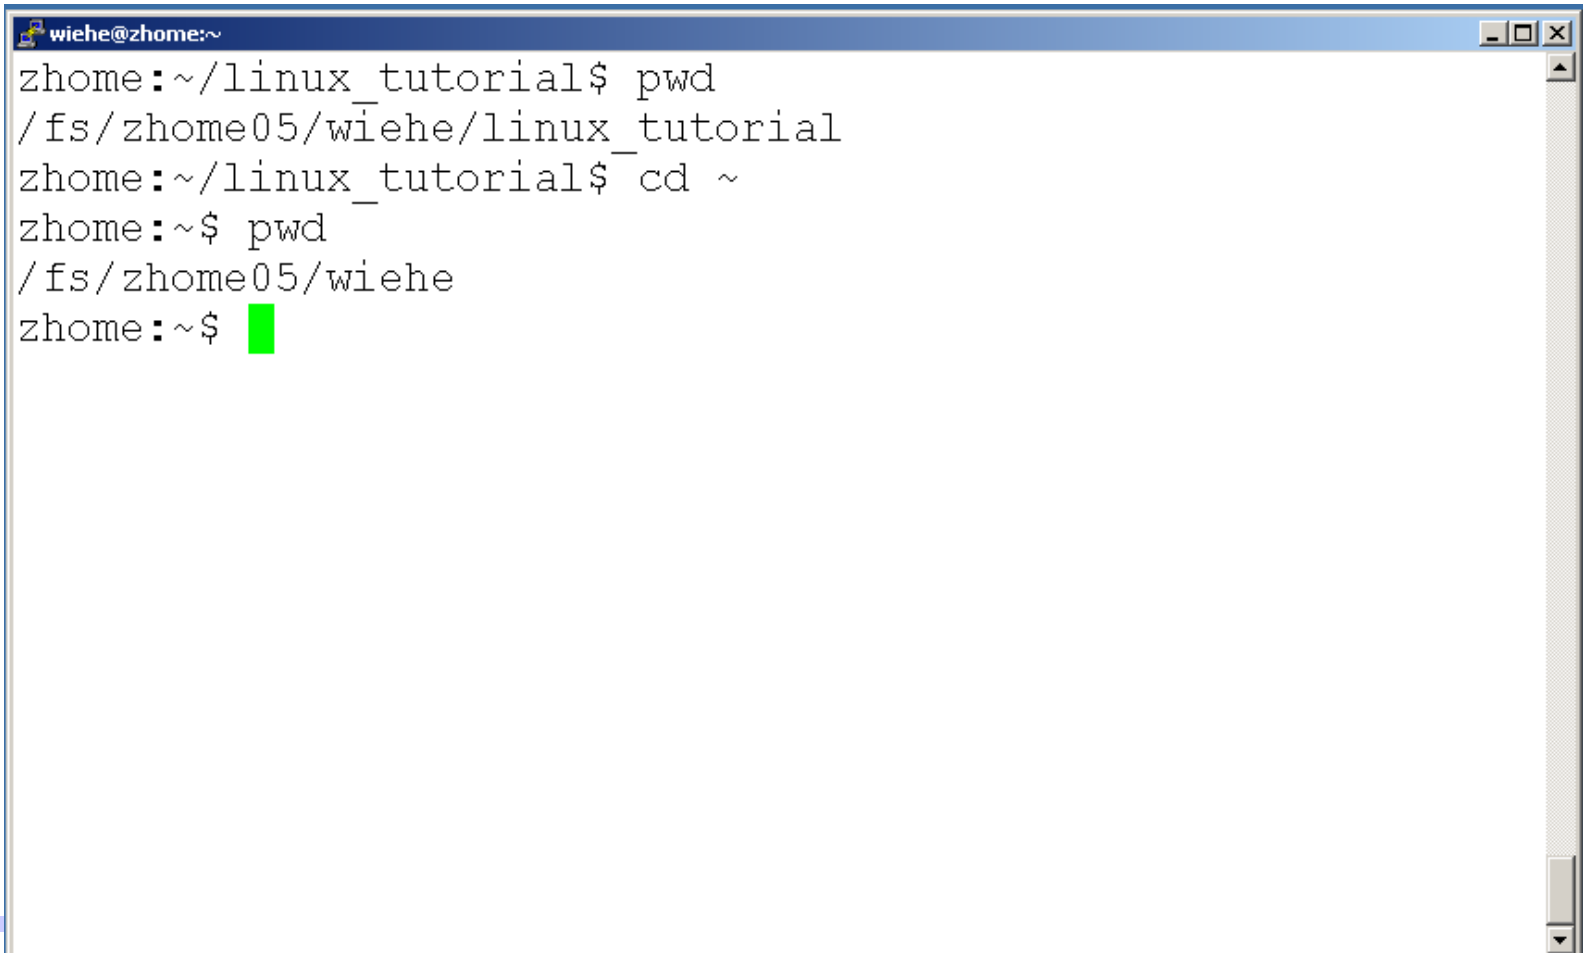

- To change to a specific directory use “cd”

```
wiehe@zhome:~/linux_tutorial
zhome:~$ pwd
/fs/zhome05/wiehe
zhome:~$ cd /fs/zhome05/wiehe/linux_tutorial/
zhome:~/linux_tutorial$ pwd
/fs/zhome05/wiehe/linux_tutorial
zhome:~/linux_tutorial$ █
```

Command: cd

- “~” is the location of your home directory

```
wiehe@zhome:~  
zhome:~/linux_tutorial$ pwd  
/fs/zhome05/wiehe/linux_tutorial  
zhome:~/linux_tutorial$ cd ~  
zhome:~$ pwd  
/fs/zhome05/wiehe  
zhome:~$ █
```

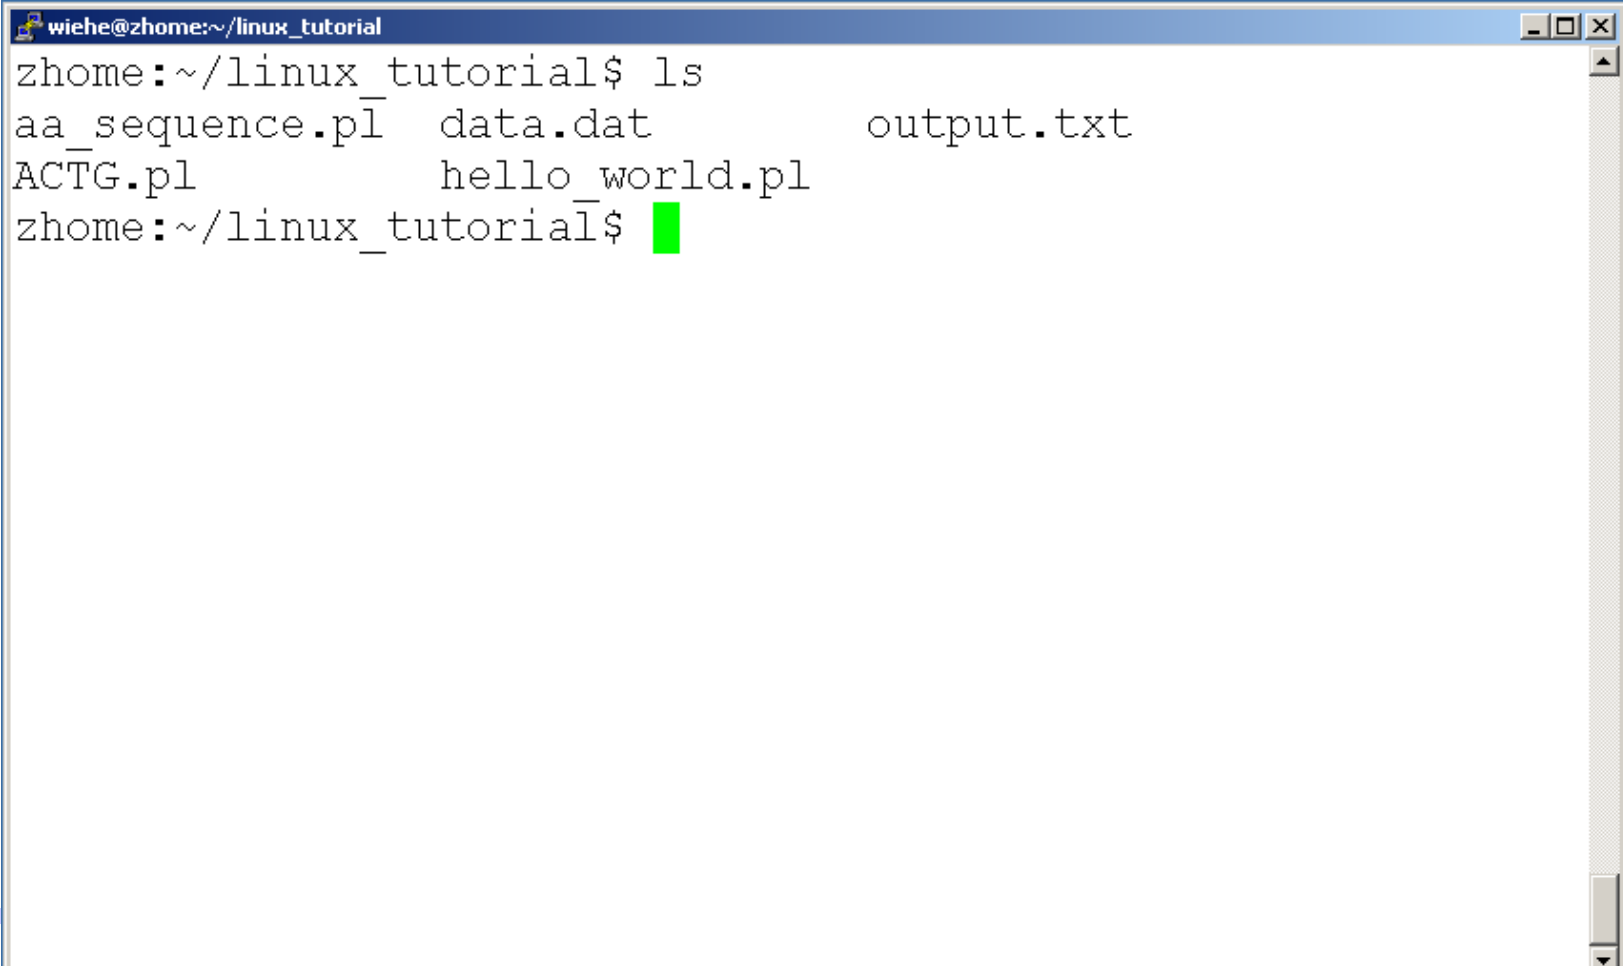

Command: cd

- “..” is the location of the directory below current one

```
wiehe@zhome:~  
zhome:~/linux_tutorial$ pwd  
/fs/zhome05/wiehe/linux_tutorial  
zhome:~/linux_tutorial$ cd ..  
zhome:~$ pwd  
/fs/zhome05/wiehe  
zhome:~$ █
```

Command: ls

- To list the files in the current directory use “ls”

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data.dat          output.txt
ACTG.pl        hello_world.pl
zhome:~/linux_tutorial$
```

Command: ls

- ls has many options
 - -l long list (displays lots of info)
 - -t sort by modification time
 - -S sort by size
 - -h list file sizes in human readable format
 - -r reverse the order
- “man ls” for more options
- Options can be combined: “ls -ltr”

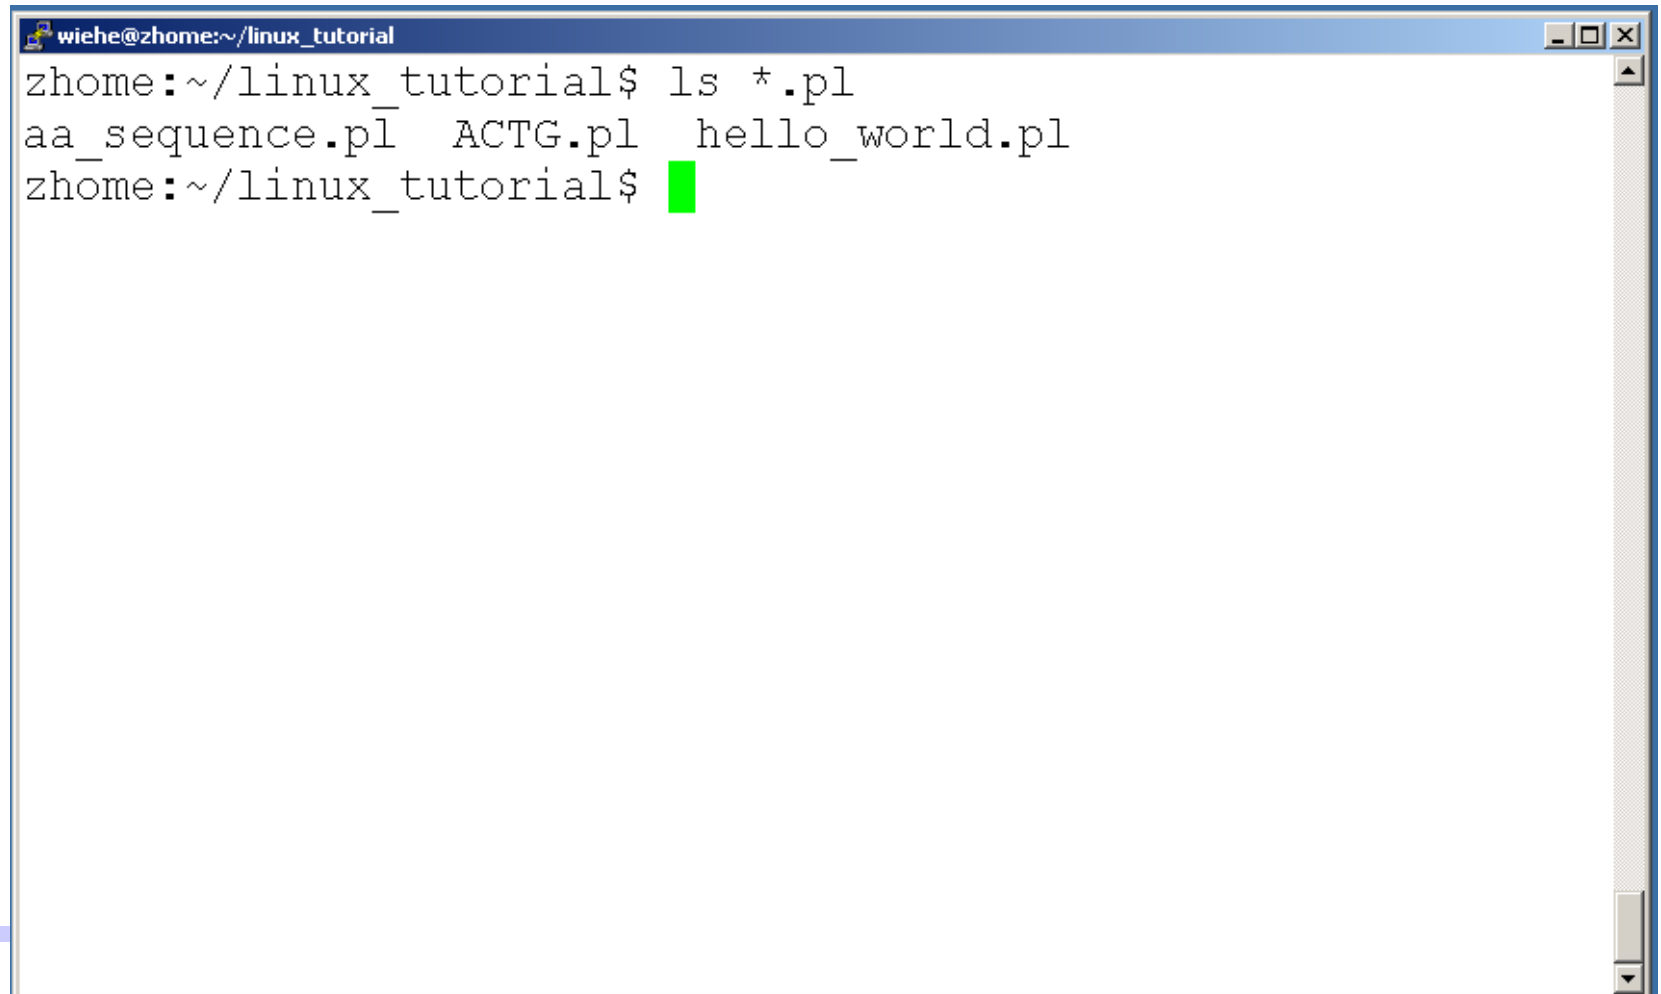

Command: ls -ltr

- List files by time in reverse order with long listing

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls -ltr
total 20
-rw-rw-r--  1 wiehe wiehe  92 Aug 30 11:54 ACTG.pl
-rw-rw-r--  1 wiehe wiehe 169 Aug 30 12:20 aa_sequence.pl
-rw-rw-r--  1 wiehe wiehe  42 Aug 30 12:22 hello_world.pl
-rw-rw-r--  1 wiehe wiehe  24 Aug 30 12:23 output.txt
-rw-rw-r--  1 wiehe wiehe  21 Aug 30 12:23 data.dat
zhome:~/linux_tutorial$
```

General Syntax: *

- "*" can be used as a wildcard in unix/linux

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls *.pl
aa_sequence.pl  ACTG.pl  hello_world.pl
zhome:~/linux_tutorial$
```

Command: mkdir

- To create a new directory use “mkdir”

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data.dat          output.txt
ACTG.pl        hello_world.pl
zhome:~/linux_tutorial$ mkdir new_directory
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data.dat          new_directory
ACTG.pl        hello_world.pl   output.txt
zhome:~/linux_tutorial$ █
```

Command: rmdir

- To remove an empty directory use “rmdir”

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data.dat          new_directory
ACTG.pl        hello_world.pl   output.txt
zhome:~/linux_tutorial$ rmdir new_directory/
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data.dat          output.txt
ACTG.pl        hello_world.pl
zhome:~/linux_tutorial$ █
```

Displaying a file

- Various ways to display a file in Unix
 - cat
 - less
 - head
 - tail

Command: cat

- Dumps an entire file to standard output
 - Good for displaying short, simple files
-

Command: less

- “less” displays a file, allowing forward/backward movement within it
 - return scrolls forward one line, space one page
 - y scrolls back one line, b one page
- use “/” to search for a string
- Press q to quit

Command: head

- “head” displays the top part of a file
- By default it shows the first 10 lines
- -n option allows you to change that
- “head -n50 file.txt” displays the first 50 lines of file.txt

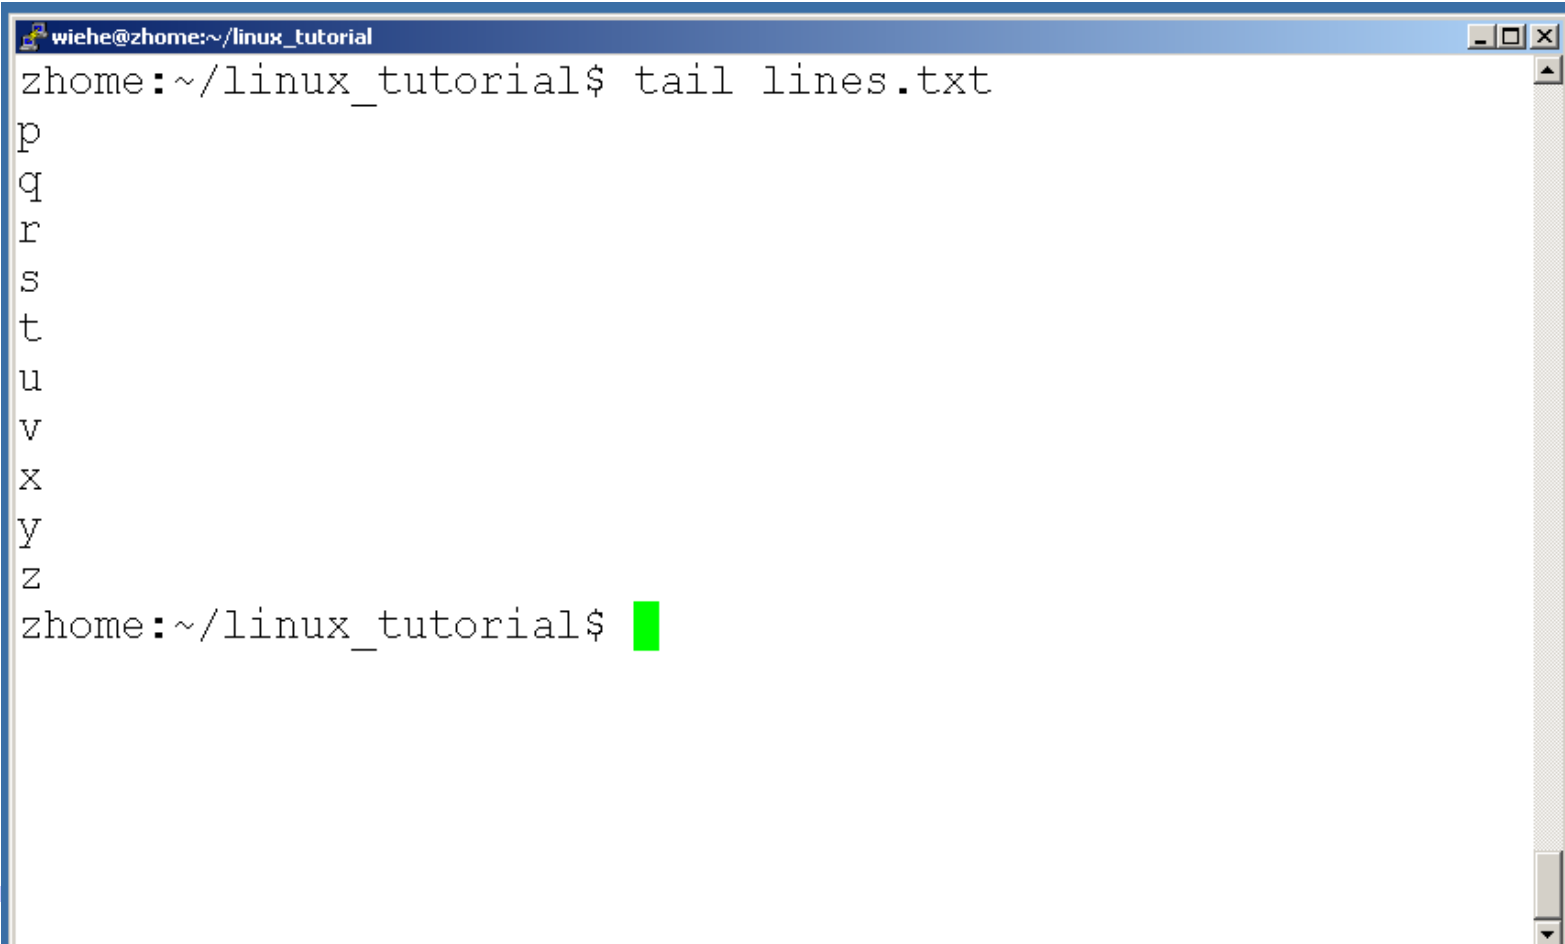

Command: head

- Here's an example of using "head":

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ head lines.txt
a
b
c
d
e
f
g
h
i
j
zhome:~/linux_tutorial$ █
```

Command: tail

- Same as head, but shows the last lines

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ tail lines.txt
p
q
r
s
t
u
v
x
y
z
zhome:~/linux_tutorial$ █
```

File Commands

- Copying a file: cp
 - Move or rename a file: mv
 - Remove a file: rm
-

Command: cp

- To copy a file use “cp”

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data.dat      lines.txt
ACTG.pl        hello_world.pl  output.txt
zhome:~/linux_tutorial$ cp data.dat data2.dat
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data2.dat  hello_world.pl  output.txt
ACTG.pl        data.dat   lines.txt
zhome:~/linux_tutorial$ █
```

Command: mv

- To move a file to a different location use “mv”

```
wiehe@zhome:~/linux_tutorial/new_directory
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data2.dat  hello_world.pl  output.txt
ACTG.pl        data.dat   lines.txt
zhome:~/linux_tutorial$ mkdir new_directory
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data2.dat  hello_world.pl  new_directory
ACTG.pl        data.dat   lines.txt       output.txt
zhome:~/linux_tutorial$ mv data2.dat ./new_directory/
zhome:~/linux_tutorial$ cd new_directory/
zhome:~/linux_tutorial/new_directory$ ls
data2.dat
zhome:~/linux_tutorial/new_directory$ █
```

Command: mv

- mv can also be used to rename a file

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data.dat          lines.txt         output.txt
ACTG.pl        hello_world.pl   new_directory
zhome:~/linux_tutorial$ mv output.txt input.txt
zhome:~/linux_tutorial$ ls
aa_sequence.pl  data.dat          input.txt         new_directory
ACTG.pl        hello_world.pl   lines.txt
zhome:~/linux_tutorial$ █
```

Command: rm

- To remove a file use “rm”

```
wiehe@zhome:~/linux_tutorial/new_directory
zhome:~/linux_tutorial$ cd new_directory/
zhome:~/linux_tutorial/new_directory$ ls
data2.dat
zhome:~/linux_tutorial/new_directory$ rm data2.dat
zhome:~/linux_tutorial/new_directory$ ls
zhome:~/linux_tutorial/new_directory$ █
```

Command: rm

- To remove a file “recursively”: `rm -r`
 - Used to remove all files and directories
 - Be very careful, deletions are permanent in Unix/Linux
-

File permissions

- Each file in Unix/Linux has an associated permission level
 - This allows the user to prevent others from reading/writing/executing their files or directories
 - Use “ls -l *filename*” to find the permission level of that file
-

Permission levels

- “r” means “read only” permission
- “w” means “write” permission
- “x” means “execute” permission
 - In case of directory, “x” grants permission to list directory contents

File Permissions

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls -l
total 28
-rw-rw-r--  1 wiehe wiehe  169 Aug 30 12:20 aa_sequence.pl
-rw-rw-r--  1 wiehe wiehe   92 Aug 30 11:54 ACTG.pl
-rw-rw-r--  1 wiehe wiehe   21 Aug 30 12:23 data.dat
-rw-rw-r--  1 wiehe wiehe   42 Aug 30 12:22 hello_world.pl
-rw-rw-r--  1 wiehe wiehe   24 Aug 30 12:23 input.txt
-rw-rw-r--  1 wiehe wiehe   50 Aug 30 13:13 lines.txt
drwxrwxr-x  2 wiehe wiehe 4096 Aug 30 13:19 new_directory
zhome:~/linux_tutorial$
```

User (you)

File Permissions

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls -l
total 28
-rw-rw-r--  1 wiehe wiehe  169 Aug 30 12:20 aa_sequence.pl
-rw-rw-r--  1 wiehe wiehe   92 Aug 30 11:54 ACTG.pl
-rw-rw-r--  1 wiehe wiehe   21 Aug 30 12:23 data.dat

zhome:~/linux_tutorial$
```

“The World”

Command: chmod

- If you own the file, you can change its permissions with “chmod”
 - Syntax: chmod [**u**ser/**g**roup/**o**thers/**a**ll]+[permission] [file(s)]
 - Below we grant execute permission to all:

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls -l hello_world.pl
-rw-rw-r-- 1 wiehe wiehe 42 Aug 30 12:22 hello_world.pl
zhome:~/linux_tutorial$ chmod a+x hello_world.pl
zhome:~/linux_tutorial$ ls -l hello_world.pl
-rwxrwxr-x 1 wiehe wiehe 42 Aug 30 12:22 hello_world.pl
zhome:~/linux_tutorial$
```

Command: ps

- To view the processes that you're running:

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ps -u wiehe
  PID TTY          TIME CMD
 1194 ?            00:00:00 sshd
 1196 pts/2        00:00:00 bash
 1255 pts/2        00:00:01 ACTG.pl
 1270 pts/2        00:00:00 ps
zhome:~/linux_tutorial$
```

Command: top

- To view the CPU usage of all processes:

```
wiehe@zhome:~/linux_tutorial
top - 13:46:33 up 50 days,  4:26,  2 users,  load avera
Tasks:  total,    running,    sleeping,    stoppe
Cpu(s):    us,      sy,      ni,      id,      w
Mem:      total,          used,          free,
Swap:     total,          used,          free,

```

PID	USER	PR	NI	VIRT	RES	SHR	S	%CPU	%MEM
3403	root	15	0	0	0	0	S	0.7	0.0
1	root	16	0	1604	324	292	S	0.0	0.0
2	root	RT	0	0	0	0	S	0.0	0.0
3	root	34	19	0	0	0	S	0.0	0.0
4	root	RT	0	0	0	0	S	0.0	0.0
5	root	34	19	0	0	0	S	0.0	0.0
6	root	RT	0	0	0	0	S	0.0	0.0
7	root	34	19	0	0	0	S	0.0	0.0
8	root	RT	0	0	0	0	S	0.0	0.0
9	root	34	19	0	0	0	S	0.0	0.0

Command: kill

- To terminate a process use “kill”

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ps -u wiehe
  PID TTY          TIME CMD
 1194 ?            00:00:00 sshd
 1196 pts/2        00:00:00 bash
 1255 pts/2        00:00:01 ACTG.pl
 1287 pts/2        00:00:00 ps
zhome:~/linux_tutorial$ kill -9 1255
[1]+  Killed                  ./ACTG.pl
zhome:~/linux_tutorial$ ps -u wiehe
  PID TTY          TIME CMD
 1194 ?            00:00:00 sshd
 1196 pts/2        00:00:00 bash
 1289 pts/2        00:00:00 ps
zhome:~/linux_tutorial$ █
```

Input/Output Redirection (“piping”)

- Programs can output to other programs
 - Called “piping”
 - “program_a | program_b”
 - program_a’s output becomes program_b’s input
 - “program_a > file.txt”
 - program_a’s output is written to a file called “file.txt”
 - “program_a < input.txt”
 - program_a gets its input from a file called “input.txt”
-

A few examples of piping

wiehe@zhome:~/linux_tutorial

```
zhome:~/linux_tutorial$ ./aa_sequence.pl | less
```

A few examples of piping

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls
aa_sequence.pl  hello_world.pl  new_directory
ACTG.pl        input.txt
data.dat       lines.txt
zhome:~/linux_tutorial$ ./aa_sequence.pl > sequence.txt
zhome:~/linux_tutorial$ ls
aa_sequence.pl  hello_world.pl  new_directory
ACTG.pl        input.txt       sequence.txt
data.dat       lines.txt
zhome:~/linux_tutorial$ less sequence.txt
```

Command: wc

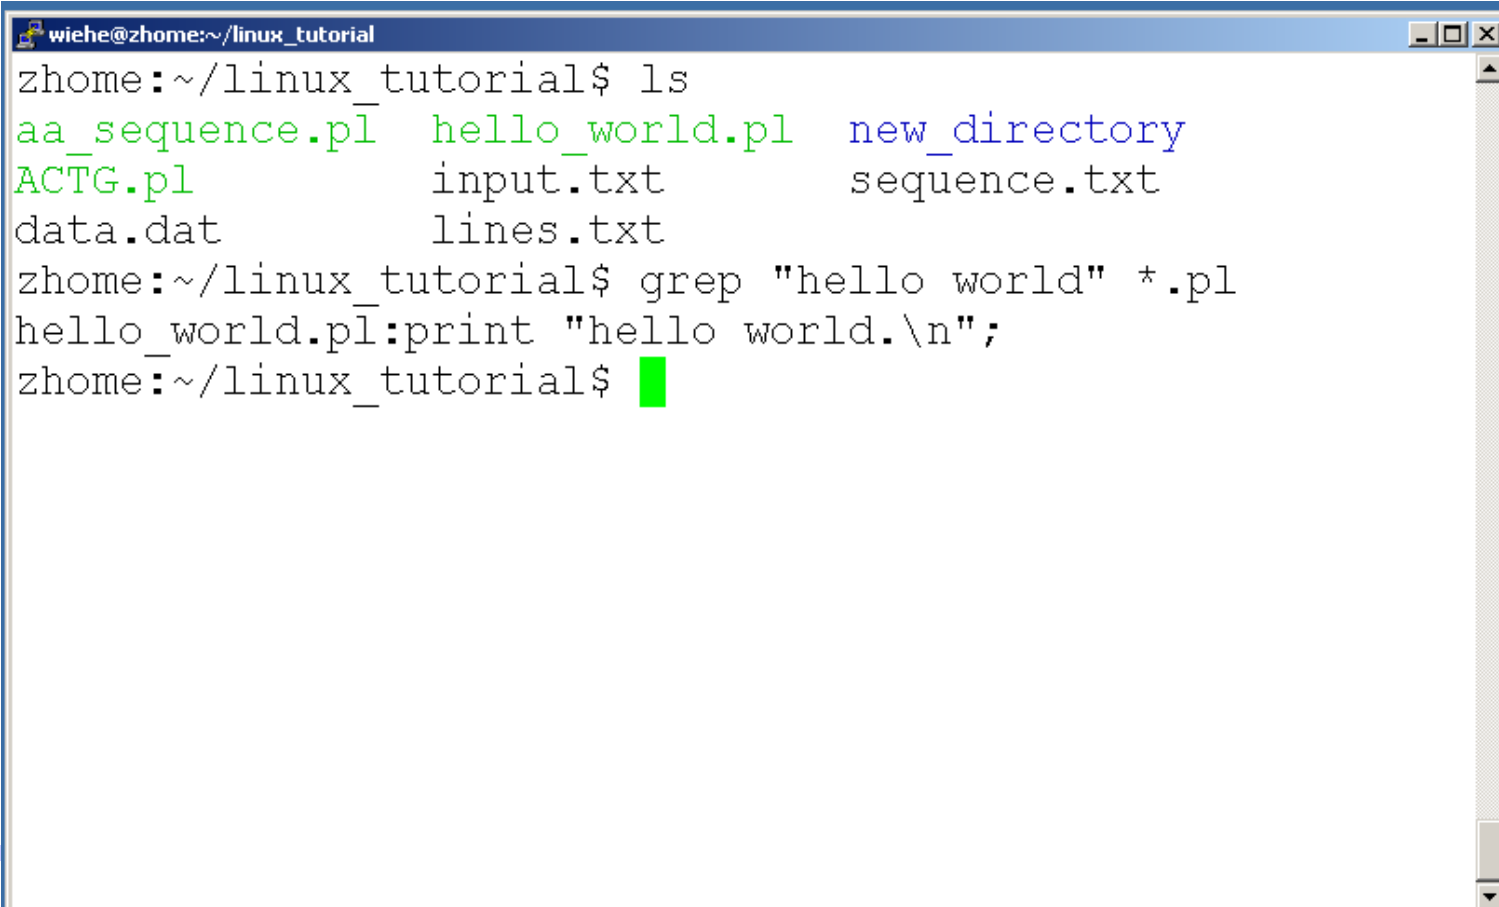

- To count the characters, words, and lines in a file use “wc”
 - The first column in the output is lines, the second is words, and the last is characters
-

A few examples of piping

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ./aa_sequence.pl | wc
      1      1     251
zhome:~/linux_tutorial$
```

Command: grep

- To search files in a directory for a specific string use “grep”

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ ls
aa_sequence.pl  hello_world.pl  new_directory
ACTG.pl        input.txt       sequence.txt
data.dat       lines.txt
zhome:~/linux_tutorial$ grep "hello world" *.pl
hello_world.pl:print "hello world.\n";
zhome:~/linux_tutorial$
```

Command: diff

- To compare to files for differences use “diff”
 - Try: `diff /dev/null hello.txt`
 - `/dev/null` is a special address -- it is always empty, and anything moved there is deleted

[gdb tutorial - link](#)

- <https://homepages.laas.fr/adoncesc>

Repeated Squaring Technique

- Step 1. Let $y=1$.
- Step 2. Is N odd? If so, let $y=y*x$.
- Step 3. Set N to the floor of $N/2$.
- Step 4. Is $N=0$? If so, stop; answer = y .
- Step 5. Set $x=x^2$ and go to Step 2.

Bash Shell

The shell of Linux

- Linux has a variety of different shells:
 - Bourne shell (sh), C shell (csh), Korn shell (ksh), TC shell (tcsh), Bourne Again shell (bash).
 - Certainly **the most popular shell is “bash”**. Bash is an **sh-compatible** shell that **incorporates useful features from the Korn shell (ksh) and C shell (csh)**.
 - It is intended to **conform to the IEEE POSIX P1003.2/ISO 9945.2 Shell and Tools standard**.
 - It offers functional **improvements** over sh for both **programming and interactive use**.
-

Programming or Scripting ?

- bash is not only an **excellent command line shell**, but a **scripting language** in itself. Shell scripting allows us to use the shell's abilities and to **automate a lot of tasks** that would otherwise require a lot of commands.
- Difference between **programming and scripting languages**:
 - **Programming languages** are generally a lot **more powerful and a lot faster than scripting languages**. Programming languages generally start from source code and are compiled into an **executable**. This executable is **not easily ported** into different operating systems.
 - A **scripting language** also starts from source code, but **is not compiled into an executable**. Rather, an **interpreter** reads the instructions in the source file and **executes each instruction**. Interpreted programs are **generally slower than compiled programs**. The main advantage is that you can **easily port** the source file to any operating system. bash is a scripting language. Other examples of scripting languages are Perl, Lisp, and Tcl.

The first bash program

- There are two major text editors in Linux:
 - vi, emacs (or xemacs).
- So fire up a text editor; for example:

```
$ vi &
```

and type the following inside it:

```
#!/bin/bash  
echo "Hello World"
```

- The first line tells Linux to use the bash interpreter to run this script. We call it hello.sh. Then, make the script executable:

```
$ chmod 700 hello.sh  
$ ./hello.sh  
Hello World
```

The second bash program

- We write a program that copies all files into a directory, and then deletes the directory along with its contents. This can be done with the following commands:

```
$ mkdir trash  
$ cp * trash  
$ rm -rf trash  
$ mkdir trash
```

- Instead of having to type all that interactively on the shell, write a shell program instead:

```
$ cat trash.sh  
#!/bin/bash  
# this script deletes some files  
cp * trash  
rm -rf trash  
mkdir trash  
echo "Deleted all files!"
```

Variables

- We can use **variables** as in any programming languages. Their values are **always stored as strings**, but there are mathematical operators in the shell language that will **convert variables to numbers for calculations**.
- We have **no need to declare a variable**, just assigning a value to its reference will create it.
- Example

```
#!/bin/bash  
STR="Hello World!"  
echo $STR
```

- Line 2 creates a variable called STR and assigns the string "Hello World!" to it. Then the value of this variable is retrieved by putting the '\$' in at the beginning.

Warning !

- The shell programming language **does not type-cast** its variables. This means that a variable can hold number data or character data.

```
count=0
```

```
count=Sunday
```

- Switching the TYPE of a variable can lead to confusion for the writer of the script or someone trying to modify it, so **it is recommended to use a variable for only a single TYPE of data** in a script.
- `\` is the bash escape character and it preserves the literal value of the next character that follows.

```
$ ls \*
```

```
ls: *: No such file or directory
```

Single and Double Quote

- When assigning character data containing spaces or special characters, the data must be enclosed in either single or double quotes.
- Using **double quotes** to show a string of characters will allow any variables in the quotes to be resolved

```
$ var="test string"  
$ newvar="Value of var is $var"  
$ echo $newvar  
Value of var is test string
```

- Using **single quotes** to show a string of characters will not allow variable resolution

```
$ var='test string'  
$ newvar='Value of var is $var'  
$ echo $newvar  
Value of var is $var
```

The export command

- The export command puts a variable into the environment so it will be accessible to child processes. For instance:

```
$ x=hello
$ bash           # Run a child shell.
$ echo $x       # Nothing in x.
$ exit         # Return to parent.
$ export x
$ bash
$ echo $x
hello           # It's there.
```

- If the child modifies x, it will not modify the parent's original value. Verify this by changing x in the following way:

```
$ x=ciao
$ exit
$ echo $x
hello
```

Environmental Variables

- There are two types of variables:
 - Local variables
 - Environmental variables
- Environmental variables are set by the system and can usually be found by using the `env` command. Environmental variables hold special values. For instance:

```
$ echo $SHELL
```

```
/bin/bash
```

```
$ echo $PATH
```

```
/usr/X11R6/bin:/usr/local/bin:/bin:/usr/bin
```

- Environmental variables are defined in `/etc/profile`, `/etc/profile.d/` and `~/.bash_profile`. These files are the **initialization files** and they are read when bash shell is invoked.
- When a login shell exits, bash reads `~/.bash_logout`
- The startup is more complex; for example, if bash is used **interactively**, then `/etc/bashrc` or `~/.bashrc` are read. See the man page for more details.

Environmental Variables

- **HOME**: The default argument (home directory) for `cd`.
- **PATH**: The search path for commands. It is a colon-separated list of directories that are searched when you type a command.
- Usually, we type in the commands in the following way:

```
$ ./command
```

- By setting **PATH=\$PATH:.** our working directory is included in the search path for commands, and we simply type:

```
$ command
```

- If we type in

```
$ mkdir ~/bin
```

- and we include the following lines in the `~/bash_profile`:

```
PATH=$PATH:$HOME/bin  
export PATH
```

- we obtain that the directory `/home/userid/bin` is included in the search path for commands.

Environment Variables

- **LOGNAME**: contains the user name
- **HOSTNAME**: contains the computer name.
- **PS1**: sequence of characters shown before the prompt

<code>\t</code>	hour
<code>\d</code>	date
<code>\w</code>	current directory
<code>\W</code>	last part of the current directory
<code>\u</code>	user name
<code>\\$</code>	prompt character

Example:

```
[userid@homelinux userid]$ PS1='hi \u *'  
hi userid* _
```

Exercise ==> Design your own new prompt. Show me when you are happy with it.

- **RANDOM**: random number generator
- **SECONDS**: seconds from the beginning of the execution

Read command

- The read command allows you to prompt for input and store it in a variable.
- Example:

```
#!/bin/bash
echo -n "Enter name of file to delete: "
read file
echo "Type 'y' to remove it, 'n' to change your mind ... "
rm -i $file
echo "That was YOUR decision!"
```

- Line 2 prompts for a string that is read in line 3. Line 4 uses the interactive remove (`rm -i`) to ask the user for confirmation.

Command Substitution

- The **backquote** “```” is different from the **single quote** “`'`”. It is used for **command substitution**:
``command``

```
$ LIST=`ls`  
$ echo $LIST  
hello.sh read.sh
```

```
$ PS1="`pwd`>"  
/home/userid/work> _
```

- We can perform the command substitution by means of **\$(command)**

```
$ LIST=$(ls)  
$ echo $LIST  
hello.sh read.sh
```

```
$ rm $( find / -name "*.tmp" )
```

```
$ cat > backup.sh  
#!/bin/bash  
BCKUP=/home/userid/backup-$(date +%d-%m-%y).tar.gz  
tar -czf $BCKUP $HOME
```

Arithmetic Evaluation

- The `let` statement can be used to do **mathematical functions**:

```
$ let X=10+2*7
```

```
$ echo $X
```

```
24
```

```
$ let Y=X+2*4
```

```
$ echo $Y
```

```
32
```

- An **arithmetic expression** can be evaluated by `$(expression)` or `=$((expression))`

```
$ echo "$((123+20))"
```

```
143
```

```
$ VALORE=$((123+20))
```

```
$ echo "$[123*$VALORE]"
```

```
17589
```

Arithmetic Evaluation

- Available operators: `+`, `-`, `/`, `*`, `%`
- Example

```
$ cat arithmetic.sh
```

```
#!/bin/bash
```

```
echo -n "Enter the first number: "; read x
```

```
echo -n "Enter the second number: "; read y
```

```
add=$(( $x + $y ))
```

```
sub=$(( $x - $y ))
```

```
mul=$(( $x * $y ))
```

```
div=$(( $x / $y ))
```

```
mod=$(( $x % $y ))
```

```
# print out the answers:
```

```
echo "Sum: $add"
```

```
echo "Difference: $sub"
```

```
echo "Product: $mul"
```

```
echo "Quotient: $div"
```

```
echo "Remainder: $mod"
```

Conditional Statements

- **Conditionals** let us decide whether to perform an action or not, this decision is taken by evaluating an expression. The most basic form is:

```
if [ expression ];  
then  
    statements  
elif [ expression ];  
then  
    statements  
else  
    statements  
fi
```

- the **elif** (else if) and **else** sections are optional
 - Put spaces after [and before], and around the operators and operands.
-

Expressions

- An **expression** can be: **String comparison**, **Numeric comparison**, **File operators** and **Logical operators** and it is represented by `[expression]`:

- String Comparisons:

= compare if two strings are **equal**
!= compare if two strings are **not equal**
-n evaluate if string **length is greater than zero**
-z evaluate if string **length is equal to zero**

- Examples:

`[s1 = s2]` (true if **s1** same as **s2**, else false)
`[s1 != s2]` (true if **s1** not same as **s2**, else false)
`[s1]` (true if **s1** is not empty, else false)
`[-n s1]` (true if **s1** has a length greater than 0, else false)
`[-z s2]` (true if **s2** has a length of 0, otherwise false)

Expressions

- Number Comparisons:

- eq compare if two numbers are **equal**
- ge compare if one number is **greater than or equal** to a number
- le compare if one number is **less than or equal** to a number
- ne compare if two numbers are **not equal**
- gt compare if one number is **greater** than another number
- lt compare if one number is **less** than another number

- Examples:

- [n1 -eq n2] (true if **n1 same as n2**, else false)
- [n1 -ge n2] (true if **n1 greater then or equal to n2**, else false)
- [n1 -le n2] (true if **n1 less then or equal to n2**, else false)
- [n1 -ne n2] (true if **n1 is not same as n2**, else false)
- [n1 -gt n2] (true if **n1 greater then n2**, else false)
- [n1 -lt n2] (true if **n1 less then n2**, else false)

Examples

```
$ cat user.sh
```

```
#!/bin/bash
echo -n "Enter your login name: "
read name
if [ "$name" = "$USER" ];
then
    echo "Hello, $name. How are you today ?"
else
    echo "You are not $USER, so who are you ?"
fi
```

```
$ cat number.sh
```

```
#!/bin/bash
echo -n "Enter a number 1 < x < 10: "
read num
if [ "$num" -lt 10 ]; then
    if [ "$num" -gt 1 ]; then
        echo "$num*$num=$((($num*$num))"
    else
        echo "Wrong insertion !"
    fi
else
    echo "Wrong insertion !"
fi
```

Expressions

- Files operators:

- d check if path given is a **directory**
- f check if path given is a **file**
- e check if file name **exists**
- r check if **read permission** is set for file or directory
- s check if a file has a **length greater than 0**
- w check if **write permission** is set for a file or directory
- x check if **execute permission** is set for a file or directory

- Examples:

- [-d fname] (true if **fname is a directory**, otherwise false)
- [-f fname] (true if **fname is a file**, otherwise false)
- [-e fname] (true if **fname exists**, otherwise false)
- [-s fname] (true if **fname length is greater than 0**, else false)
- [-r fname] (true if **fname has the read permission**, else false)
- [-w fname] (true if **fname has the write permission**, else false)
- [-x fname] (true if **fname has the execute permission**, else false)

Example

```
#!/bin/bash
if [ -f /etc/fstab ];
then
    cp /etc/fstab .
    echo "Done."
else
    echo "This file does not exist."
    exit 1
fi
```

Exercise.

- Write a shell script which:
 - accepts a file name
 - checks if file exists
 - if file exists, copy the file to the same name + .bak + the current date (if the backup file already exists ask if you want to replace it).
- When done you should have the original file and one with a .bak at the end.

Expressions

- Logical operators:

! negate (**NOT**) a logical expression
-a logically **AND** two logical expressions
-o logically **OR** two logical expressions

Example:

```
#!/bin/bash
echo -n "Enter a number 1 < x < 10:"
read num
if [ "$num" -gt 1 -a "$num" -lt 10 ];
then
    echo "$num*$num=$((($num*$num))"
else
    echo "Wrong insertion !"
fi
```

Expressions

- Logical operators:

&& logically **AND** two logical expressions
|| logically **OR** two logical expressions

Example:

```
#!/bin/bash
echo -n "Enter a number 1 < x < 10: "
read num
if [ "$number" -gt 1 ] && [ "$number" -lt 10 ];
then
    echo "$num*$num=$(($num*$num))"
else
    echo "Wrong insertion !"
fi
```

Example

```
$ cat iftrue.sh
#!/bin/bash
echo "Enter a path: "; read x
if cd $x; then
    echo "I am in $x and it contains"; ls
else
    echo "The directory $x does not exist";
    exit 1
fi
```

```
$ iftrue.sh
Enter a path: /home
userid anotherid ...
$ iftrue.sh
Enter a path: blah
The directory blah does not exist
```

Shell Parameters

- **Positional parameters** are assigned from the shell's argument when it is invoked. Positional parameter "N" may be referenced as "\${N}", or as "\$N" when "N" consists of a single digit.
- Special parameters

\$# is the **number of parameters** passed

\$0 returns the **name of the shell script** running as well as its location in the file system

\$* gives a single word containing **all the parameters** passed to the script

\$@ gives an **array of words** containing **all the parameters** passed to the script

```
$ cat sparameters.sh
```

```
#!/bin/bash
```

```
echo "$#; $0; $1; $2; $*; $@"
```

```
$ sparameters.sh arg1 arg2
```

```
2; ./sparameters.sh; arg1; arg2; arg1 arg2; arg1 arg2
```

Trash

```
$ cat trash.sh
#!/bin/bash
if [ $# -eq 1 ];
then
    if [ ! -d "$HOME/trash" ];
    then
        mkdir "$HOME/trash"
    fi
    mv $1 "$HOME/trash"
else
    echo "Use: $0 filename"
    exit 1
fi
```

Case Statement

- Used to execute statements based on specific values. Often used in place of an if statement if there are a large number of conditions.
- Value used can be an [expression](#)
- each set of statements must be ended by a [pair of semicolons](#);
- a `*`) is used to accept any value not matched with list of values

```
case $var in
val1)
    statements;;
val2)
    statements;;
*)
    statements;;
esac
```

Example (case.sh)

```
$ cat case.sh
#!/bin/bash
echo -n "Enter a number 1 < x < 10: "
read x
case $x in
    1) echo "Value of x is 1.";;
    2) echo "Value of x is 2.";;
    3) echo "Value of x is 3.";;
    4) echo "Value of x is 4.";;
    5) echo "Value of x is 5.";;
    6) echo "Value of x is 6.";;
    7) echo "Value of x is 7.";;
    8) echo "Value of x is 8.";;
    9) echo "Value of x is 9.";;
    0 | 10) echo "wrong number.";;
    *) echo "Unrecognized value.";;
esac
```

Iteration Statements

- The `for structure` is used when you are looping through a range of variables.

```
for var in list
do
  statements
done
```

- statements are executed with `var` set to each value in the list.
- Example

```
#!/bin/bash
let sum=0
for num in 1 2 3 4 5
do
  let "sum = $sum + $num"
done
echo $sum
```

Iteration Statements

```
#!/bin/bash
for x in paper pencil pen
do
    echo "The value of variable x is: $x"
    sleep 1
done
```

- if the list part is left off, var is set to each parameter passed to the script (\$1, \$2, \$3,...)

```
$ cat for1.sh
#!/bin/bash
for x
do
    echo "The value of variable x is: $x"
    sleep 1
done
```

```
$ for1.sh arg1 arg2
The value of variable x is: arg1
The value of variable x is: arg2
```

Example (old.sh)

```
$ cat old.sh
#!/bin/bash
# Move the command line arg files to old directory.
if [ $# -eq 0 ] #check for command line arguments
then
    echo "Usage: $0 file ..."
    exit 1
fi
if [ ! -d "$HOME/old" ]
then
    mkdir "$HOME/old"
fi
echo The following files will be saved in the old directory:
echo $*
for file in $* #loop through all command line arguments
do
    mv $file "$HOME/old/"
    chmod 400 "$HOME/old/$file"
done
ls -l "$HOME/old"
```

Example (args.sh)

```
$ cat args.sh
#!/bin/bash
# Invoke this script with several arguments: "one two three"
if [ ! -n "$1" ]; then
    echo "Usage: $0 arg1 arg2 ..." ; exit 1
fi
echo ; index=1 ;
echo "Listing args with \"\$*\":"
for arg in "$*" ;
do
    echo "Arg $index = $arg"
    let "index+=1" # increase variable index by one
done
echo "Entire arg list seen as single word."
echo ; index=1 ;
echo "Listing args with \"\$@":"
for arg in "$@" ; do
    echo "Arg $index = $arg"
    let "index+=1"
done
echo "Arg list seen as separate words." ; exit 0
```

Using Arrays with Loops

- In the bash shell, we may use **arrays**. The simplest way to create one is using one of the two subscripts:

```
pet[0]=dog
pet[1]=cat
pet[2]=fish
pet=(dog cat fish)
```

- We may have **up to 1024 elements**. To **extract** a value, type `${arrayname[i]}`

```
$ echo ${pet[0]}
dog
```

- To **extract all the elements**, use an asterisk as:

```
echo ${arrayname[*]}
```

- We can **combine arrays with loops** using a for loop:

```
for x in ${arrayname[*]}
do
    ...
done
```

A C-like for loop

- An **alternative** form of the **for** structure is

```
for (( EXPR1 ; EXPR2 ; EXPR3 ))  
do  
    statements  
done
```

- First, the arithmetic expression EXPR1 is evaluated. EXPR2 is then evaluated repeatedly until it evaluates to 0. Each time EXPR2 is evaluates to a non-zero value, statements are executed and EXPR3 is evaluated.

```
$ cat for2.sh  
#!/bin/bash  
echo -n "Enter a number: "; read x  
let sum=0  
for (( i=1 ; $i<$x ; i=$i+1 )) ; do  
    let "sum = $sum + $i"  
done  
echo "the sum of the first $x numbers is: $sum"
```

Debugging

- Bash provides two options which will give useful information for debugging
 - x : displays each line of the script with variable substitution and before execution
 - v : displays each line of the script as typed before execution
- Usage:

`#!/bin/bash -v` or `#!/bin/bash -x` or `#!/bin/bash -xv`

`$ cat for3.sh`

```
#!/bin/bash -x
echo -n "Enter a number: "; read x
let sum=0
for (( i=1 ; $i<$x ; i=$i+1 )) ; do
    let "sum = $sum + $i"
done
echo "the sum of the first $x numbers is: $sum"
```

Debugging

```
$ for3.sh
+ echo -n 'Enter a number: '
Enter a number: + read x
3
+ let sum=0
+ (( i=0 ))
+ (( 0<=3 ))
+ let 'sum = 0 + 0'
+ (( i=0+1 ))
+ (( 1<=3 ))
+ let 'sum = 0 + 1'
+ (( i=1+1 ))
+ (( 2<=3 ))
+ let 'sum = 1 + 2'
+ (( i=2+1 ))
+ (( 3<=3 ))
+ let 'sum = 3 + 3'
+ (( i=3+1 ))
+ (( 4<=3 ))
+ echo 'the sum of the first 3 numbers is: 6'
the sum of the first 3 numbers is: 6
```

While Statements

- The while structure is a looping structure. Used to **execute a set of commands while a specified condition is true**. The loop terminates as soon as the condition becomes false. If condition never becomes false, loop will never exit.

```
while expression
do
    statements
done
```

```
$ cat while.sh
#!/bin/bash
echo -n "Enter a number: "; read x
let sum=0; let i=1
while [ $i -le $x ]; do
    let "sum = $sum + $i"
    i=$((i+1))
done
echo "the sum of the first $x numbers is: $sum"
```

Menu

```
$ cat menu.sh
#!/bin/bash
clear ; loop=y
while [ "$loop" = y ] ;
do
    echo "Menu"; echo "===="
        echo "D: print the date"
    echo "W: print the users who are currently log on."
    echo "P: print the working directory"
    echo "Q: quit."
    echo
    read -s choice          # silent mode: no echo to terminal
    case $choice in
        D | d) date ;;
        W | w) who ;;
        P | p) pwd ;;
        Q | q) loop=n ;;
        *) echo "Illegal choice." ;;
    esac
    echo
done
```

Find a Pattern and Edit

```
$ cat grepedit.sh
#!/bin/bash
# Edit argument files $2 ..., that contain pattern $1
if [ $# -le 1 ]
then
    echo "Usage: $0 pattern file ..." ; exit 1
else
    pattern=$1                # Save original $1
    shift                    # shift the positional parameter to the left by 1
    while [ $# -gt 0 ]       # New $1 is first filename
    do
        grep "$pattern" $1 > /dev/null
        if [ $? -eq 0 ] ; then # If grep found pattern
            vi $1              # then vi the file
        fi
        shift
    done
fi
$ grepedit.sh while ~
```

Continue Statements

- The `continue` command causes a jump to the next iteration of the loop, skipping all the remaining commands in that particular loop cycle.

```
$ cat continue.sh
```

```
#!/bin/bash
```

```
LIMIT=19
```

```
echo
```

```
echo "Printing Numbers 1 through 20 (but not 3 and 11)"
```

```
a=0
```

```
while [ $a -le "$LIMIT" ]; do
```

```
    a=$((a+1))
```

```
    if [ "$a" -eq 3 ] || [ "$a" -eq 11 ]
```

```
    then
```

```
        continue
```

```
    fi
```

```
    echo -n "$a "
```

```
done
```

Break Statements

- The `break` command **terminates the loop** (breaks out of it).

```
$ cat break.sh
```

```
#!/bin/bash
```

```
LIMIT=19
```

```
echo
```

```
echo "Printing Numbers 1 through 20, but something happens after 2 ... "
```

```
a=0
```

```
while [ $a -le "$LIMIT" ]
```

```
do
```

```
  a=$((a+1))
```

```
  if [ "$a" -gt 2 ]
```

```
  then
```

```
    break
```

```
  fi
```

```
  echo -n "$a "
```

```
done
```

```
echo; echo; echo
```

```
exit 0
```

Until Statements

- The `until` structure is very similar to the `while` structure. The `until` structure **loops until the condition is true**. So basically it is “until this condition is true, do this”.

```
until [expression]
do
    statements
done
```

```
$ cat countdown.sh
#!/bin/bash
echo "Enter a number: "; read x
echo ; echo Count Down
until [ "$x" -le 0 ]; do
    echo $x
    x=$(( $x - 1 ))
    sleep 1
done
echo ; echo GO !
```

Manipulating Strings

- Bash supports a number of **string manipulation operations**.

`#{#string}` gives the string **length**

`{string:position}` extracts **sub-string** from \$string at \$position

`{string:position:length}` extracts **\$length** characters of **sub-string** from \$string at \$position

- Example

```
$ st=0123456789
```

```
$ echo ${#st}
```

```
10
```

```
$ echo ${st:6}
```

```
6789
```

```
$ echo ${st:6:2}
```

```
67
```

Parameter Substitution

- Manipulating and/or expanding variables

`${parameter-default}`, if parameter not set, use default.

```
$ echo ${username-`whoami`}
alice
$ username=bob
$ echo ${username-`whoami`}
bob
```

`${parameter=default}`, if parameter not set, set it to default.

```
$ unset username
$ echo ${username=`whoami`}
$ echo $username
alice
```

`${parameter+value}`, if parameter set, use value, else use null string.

```
$ echo ${username+bob}
bob
```

Parameter Substitution

`${parameter?msg}`, if parameter set, use it, else print msg

```
$ value=${total?'total is not set'}
total: total is not set
$ total=10
$ value=${total?'total is not set'}
$ echo $value
10
```

Example

```
#!/bin/bash
OUTFILE=symlinks.list           # save file
directory=${1-`pwd`}
for file in “$( find $directory -type l )”
                                # -type l == symbolic links
do
    echo “$file”
done | sort >> “$HOME/$OUTFILE”
exit 0
```

Functions

- Functions make scripts easier to maintain. Basically it breaks up the program into smaller pieces. A function performs an action defined by you, and it can return a value if you wish.

```
#!/bin/bash
hello()
{
echo "You are in function hello()"
}

echo "Calling function hello()..."
hello
echo "You are now out of function hello()"
```

- In the above, we called the `hello()` function by name by using the line: `hello .` When this line is executed, bash searches the script for the line `hello()`. It finds it right at the top, and executes its contents.

Functions

```
$ cat function.sh
#!/bin/bash
function check() {
if [ -e "/home/$1" ]
then
    return 0
else
    return 1
fi
}
echo "Enter the name of the file: " ; read x
if check $x
then
    echo "$x exists !"
else
    echo "$x does not exists !"
fi.
```

Example: Picking a random card from a deck

```
#!/bin/bash
```

```
# Count how many elements.
```

```
Suites="Clubs Diamonds Hearts Spades"
```

```
Denominations="2 3 4 5 6 7 8 9 10 Jack Queen King Ace"
```

```
# Read into array variable.
```

```
suite=($Suites)
```

```
denomination=($Denominations)
```

```
# Count how many elements.
```

```
num_suites=${#suite[*]}
```

```
num_denominations=${#denomination[*]}
```

```
echo -n "${denomination[$((RANDOM%num_denominations))]} of "
```

```
echo ${suite[$((RANDOM%num_suites))]}
```

```
exit 0
```

Example: Changes all filenames to lowercase

```
#!/bin/bash
for filename in *
do
    # Traverse all files in directory.

    # Get the file name without the path.
    fname=`basename $filename`
    # Change name to lowercase.
    n=`echo $fname | tr A-Z a-z`
    if [ "$fname" != "$n" ]
    # Rename only files not already lowercase.
    then
        mv $fname $n
    fi
done
exit 0
```

Example: Compare two files with a script

```
#!/bin/bash
ARGS=2                                # Two args to script expected.
if [ $# -ne "$ARGS" ]; then
    echo "Usage: `basename $0` file1 file2" ; exit 1
fi
if [[ ! -r "$1" || ! -r "$2" ]]; then
    echo "Both files must exist and be readable." ; exit 2
fi
                                     # /dev/null buries the output of the "cmp" command.
cmp $1 $2 &> /dev/null
                                     # Also works with 'diff', i.e., diff $1 $2 &> /dev/null
if [ $? -eq 0 ]                       # Test exit status of "cmp" command.
then
    echo "File \"$1\" is identical to file \"$2\"."
else
    echo "File \"$1\" differs from file \"$2\"."
fi
exit 0
```

Example: Suite drawing statistics

```
$ cat cardstats.sh
#!/bin/sh # -xv
N=100000
hits=(0 0 0 0) # initialize hit counters
if [ $# -gt 0 ]; then          # check whether there is an argument
    N=$1
else                          # ask for the number if no argument
    echo "Enter the number of trials: "
    TMOUT=5                   # 5 seconds to give the input
    read N
fi
i=$N
echo "Generating $N random numbers... please wait."
SECONDS=0                    # here is where we really start
while [ $i -gt 0 ]; do # run until the counter gets to zero
    case $(RANDOM%4) in
        0) let "hits[0]+=1";; # randmize from 0 to 3
        1) let "hits[1]=$(hits[1]+1)";; # count the hits
        2) let hits[2]=$((${hits[2]}+1));;
        3) let hits[3]=$((${hits[3]}+1));;

Challenge/Project: collect

- Write a utility to collect “well-known” files into convenient directory holders.

`collect <directory>*`

- The utility should `collect` all executables, libraries, sources and includes from each directory `given on the command line or entered by the user` (if no arguments were passed) into separate directories. By default, the allocation is as follows:
 - `executables` go to `~/bin`
 - `libraries` (`lib*.*`) go to `~/lib`
 - `sources` (`*.c`, `*.cc`, `*.cpp`, `*.cxx`) go to `~/src`
 - `includes` (`*.h`, `*.hxx`) go to `~/inc`
- The utility should ask whether another directory should be used in place of these default directories.
- Each move should be `recorded in a log file` that may be used to reverse the moves (extra points for writing a `reverse` utility!). The user should have an option to use a log file other than the default (`~/organize.log`).
- At the end, `the utility should print statistics on file allocation`: how many directories were processed, how many files in each category were moved and how long the reorganization was (the `processing time in seconds`).
- The utility should wait only limited time for user input; if no input, then use defaults.
