- Overview of dynamical hybrid systems framework of Teel et al.
- Problem statement and proposed solution
- Numerical example
- Concluding remarks

L2S Paris, 20-22 November 2012

Goal of this work

• Context. Employ tools from Hybrid dynamical systems within control of Linear time-delay plants

Not much work done in this context – recent work [Liu, Teel CDC2012]

- Objective. Use hybrid loops or resets for stability recovery:
 - ▷ start from a *linear closed-loop* where controller K stabilizes the plant P₀ without any time delay;
 - ▷ recover (delay-independent) global exponential stability with time-delay plant \mathcal{P}_{θ} by enforcing suitable resets in the controller.

Hybrid techniques reach beyond limits of classical control

- We will design a hybrid loop to augment to the continuous-time controller by jump rules that recover stability **lost due to the delay**
 - ▷ For this we use reset control systems formalism or, more generally hybrid dynamical systems formalism [Teel, Goebel, Sanfelice 2011]

• The use of hybrid systems is desirable due to their capability to:

- provide global asymptotic stability of closed-loops not stabilizable by continuous feedback (see e.g. [Hespanha et al, 1999, 2003]).
- guarantee a robustness with respect to small errors in the loop, which cannot be obtained using classical (i.e. with a continuous dynamics) controllers (see e.g. [Prieur 2005, Goebel and Teel, 2009]).
- improve the performance of linear systems in presence of disturbances [Becker et al, 2004, Nesic et al, 2008, Witvoet et al, 2007]
- More generally, hybrid systems can model a wider range of physical problems and provide improved observers [Allgower et al. 2007, Prieur et al. 2012]

Hybrid dynamical systems review: dynamics

 $\mathcal{H} = (C, D, F, G)$

- $n \in \mathbb{N}$ (state dimension)
- $C \subseteq \mathbb{R}^2$ (flow set)
- $D \subseteq \mathbb{R}^2$ (jump set)
- $F: C \rightrightarrows \mathbb{R}^2$ (flow map)
- $G: D \rightrightarrows \mathbb{R}^2$ (jump map)

$$\mathcal{H}: \left\{ \begin{array}{ll} \dot{x} \in F(x) & x \in C \\ x^+ \in G(x) & x \in D \end{array} \right.$$

Hybrid dynamical systems review: continuous dynamics

 $\mathcal{H}=(C,D,F,G)$

- $n \in \mathbb{N}$ (state dimension)
- $C \subseteq \mathbb{R}^2$ (flow set)
- $D \subseteq \mathbb{R}^2$ (jump set)
- $F: C \rightrightarrows \mathbb{R}^2$ (flow map)
- $G: D \rightrightarrows \mathbb{R}^2$ (jump map)

$$\mathcal{H}: \left\{ \begin{array}{ll} \dot{x} \in F(x) & x \in C \\ x^+ \in G(x) & x \in D \end{array} \right.$$

$$\begin{cases} \dot{x}_{1} = x_{2} \\ \dot{x}_{2} = -x_{1} + x_{2}(1 - x_{1}^{2}) \\ \text{Van der Pol} \\ \\ x^{N} = 0 \\ -2 \\ -4 \\ -4 \\ -2 \\ -4 \\ -2 \\ -4 \\ x_{1} \\ -2 \\ x_{1} \\ -2 \\ -4 \\ x_{1} \\ -2 \\ x$$

Hybrid dynamical systems review: discrete dynamics

- $\mathcal{H} = (\mathcal{C}, \mathcal{D}, \mathcal{F}, \mathcal{G})$
 - $n \in \mathbb{N}$ (state dimension)
 - $C \subseteq \mathbb{R}^2$ (flow set)
 - $D \subseteq \mathbb{R}^2$ (jump set)
 - $F: C \rightrightarrows \mathbb{R}^2$ flow map)
 - $G: D \rightrightarrows \mathbb{R}^2$ (jump map)

$$\mathcal{H}: \left\{ \begin{array}{ll} \dot{x} \in F(x) & x \in C \\ x^+ \in G(x) & x \in D \end{array} \right.$$

$$x^{+} \in \begin{cases} \{0,1\} & \text{if } x = 0\\ \{0,2\} & \text{if } x = 1\\ \{1,2\} & \text{if } x = 2 \end{cases}$$

A possible sequence of states from $x_0 = 0$ is:

$$(0 \cdot 1 \cdot 2 \cdot 1)^i \quad i \in N$$

Hybrid dynamical systems review: trajectories

Hybrid dynamical systems review: hybrid time

The motion of the state is parameterized by two parameters:

- t ∈ ℝ_{≥0}, takes into account the elapse of time during the continuous motion of the state;
- $j \in \mathbb{Z}_{\geq 0}$, takes into account the number of jumps during the discrete motion of the state.

Hybrid dynamical systems review: hybrid time

 $E\subseteq \mathbb{R}_{\geq 0}\times \mathbb{Z}_{\geq 0}$ is a compact hybrid time domain if

$$E = \bigcup_{j=0}^{J-1} ([t_j, t_{j+1}] \times \{j\})$$

where $0 = t_0 \leq t_1 \leq \cdots \leq t_J$.

E is a **hybrid time domain** if for all $(T, J) \in \mathbb{R}_{\geq 0} \times \mathbb{Z}_{\geq 0}$

 $E \cap ([0,T] \times \{0,1,\ldots,J\})$

is a compact hybrid time domain.

Hybrid dynamical systems review: solution

• Formally, a solution satisfies the flow dynamics when flowing and satisfies the jump dynamics when jumping

Goal of this work (recall)

• Context. Employ tools from Hybrid dynamical systems within control of Linear time-delay plants

Not much work done in this context – recent work [Liu, Teel CDC2012]

- Objective. Use hybrid loops or resets for stability recovery:
 - ▷ start from a *linear closed-loop* where controller K stabilizes the plant P₀ without any time delay;
 - ▷ recover (delay-independent) global exponential stability with time-delay plant \mathcal{P}_{θ} by enforcing suitable resets in the controller.

Plant and controller dynamics is linear

• Continuous-time linear plant with time-delay θ in the state:

$$\mathcal{P}_{\theta} \left\{ \begin{array}{l} \dot{x}_{p} = A_{p}x_{p} + A_{pd}x_{p}(t-\theta) + B_{p}u_{p} \\ y_{p} = C_{p}x_{p} \end{array} \right.$$

 \bullet Continuous-time controller stabilizing \mathcal{P}_0 is:

$$\mathcal{K} \left\{ \begin{array}{l} \dot{x}_c = A_c x_p + B_c y_p \\ u_p = C_c x_c \end{array} \right.$$

Problem Formulation

• Continuous-time closed-loop with delay without resets may be unstable:

$$\begin{cases} \dot{x}_p = A_p x_p + A_{pd} x_p (t - \theta) + B_p C_c x_c \\ \dot{x}_c = A_c x_c + B_c C_p x_p \end{cases}$$

- Define the augmented state $x = \begin{vmatrix} x_p \\ x_c \\ x_p(t-\theta) = x_{pd} \end{vmatrix}$
- Problem: Determine K_{D} , C, \mathcal{D} augmenting the above closed loop as

$$\begin{aligned} \dot{x}_{p} &= A_{p}x_{p} + A_{pd}x_{pd} + B_{p}C_{c}x_{c} \\ \dot{x}_{c} &= A_{c}x_{c} + B_{c}C_{p}x_{p} \\ x_{p}^{+} &= x_{p} \\ x_{c}^{+} &= K_{p}x_{p} \end{aligned} \right\} \qquad x \in \mathcal{D}$$

with the goal to **recover global asymptotic stability** of the origin. • Recall: \mathcal{C} , \mathcal{D} are the flow and jump sets. L2S Paris, 20-22 November 2012 13 /

ST & LZ (LAAS-CNRS)

Paris 2012

Delay-independent results require assumption on \mathcal{P}_{θ}

- \mathcal{P}_{θ} must be good enough to allow for Lyapunov-Krasovskii functionals
- Assumption LK. Given the matrices in \mathcal{P}_{θ} , there exist two symmetric positive definite matrices P_p and Q, a positive scalar ϵ_p and a "hybrid gain" K_p such that

$$\begin{bmatrix} (A_{p} + B_{p}C_{c}K_{p})'P_{p} + P_{p}(A_{p} + B_{p}C_{c}K_{p}) + Q & P_{p}A_{pd} \\ A'_{pd}P_{p} & -Q \end{bmatrix}$$
$$\leq -2\epsilon_{p}\begin{bmatrix} P_{p} & 0 \\ 0 & Q \end{bmatrix}$$

 Meaning of Assumption LK: delay-independent stability of the linear time-delay plant stabilized by K_p :

 $\dot{z}(t) = (A_p + B_p C_c K_p) z(t) + A_{pd} z(t-\theta) = A_K z(t) + A_{pd} z(t-\theta)$

• z dynamics coincides with the closed loop dynamics with delay when clamping $x_c = K_p x_p$

Convex formulation helps optimizing P_p , K_p , Q, ϵ_p

• Lemma LK Assumption LK holds with $|K_p| \leq \kappa_{max}$ if and only if there exist two symmetric positive definite matrices Q_p and S, a positive scalar ϵ_p and a matrix X such that:

$$\begin{aligned} |X| &\leq \kappa_{\max}, \qquad Q_p \geq I \\ \begin{bmatrix} Q_p A'_p + X' C'_c B'_p + A_p Q_p + B_p C_c X + S & A_{pd} Q_p \\ Q_p A'_{pd} & -S \end{bmatrix} \\ &\leq -2\epsilon_p \begin{bmatrix} Q_p & 0 \\ 0 & S \end{bmatrix} \end{aligned}$$

One then can build the following solution to Assumption LK

$$K_p = XQ_p^{-1}, \quad Q = Q_p^{-1}SQ_p^{-1}, \quad P_p = Q_p^{-1}$$

• Maximizing ϵ_p is a Generalized Eigenvalue Problem (qausi-convex)

• Recall that $x_c \equiv K_p x_p$ induces exponentially stable dynamics $\dot{z}(t) = (A_p + B_p C_c K_p) z(t) + A_{pd} z(t - \theta) = A_K z(t) + A_{pd} z(t - \theta)$ L2S Paris, 20-22 November 2012

Problem solution: use resets to go back to z dynamics

• **Solution**: define the coordinate $\xi = [x_p \ x_{pd} \ x_c - K_p x_p]^T$ and select $K_p = K_p$ from Lemma LK and for any $\epsilon_c > 0$ fix

 $\mathcal{C} = \left\{ \xi' \mathsf{He} \begin{bmatrix} P_p A_{\mathcal{K}} + Q/2 & P_p A_{pd} & P_p B_p C_c \\ 0 & -Q/2 & 0 \\ 0 & 0 & \epsilon_c I \\ \end{bmatrix} \xi \leq \xi' \begin{bmatrix} -\epsilon_p P_p & 0 & 0 \\ 0 & -\epsilon_p Q & 0 \\ 0 & 0 & 0 \end{bmatrix} \xi \right\}$ $\mathcal{D} = \left\{ \xi' \mathsf{He} \begin{bmatrix} P_p A_{\mathcal{K}} + Q/2 & P_p A_{pd} & P_p B_p C_c \\ 0 & -Q/2 & 0 \\ 0 & 0 & \epsilon_c I \end{bmatrix} \xi \geq \xi' \begin{bmatrix} -\epsilon_p P_p & 0 & 0 \\ 0 & -\epsilon_p Q & 0 \\ 0 & 0 & 0 \end{bmatrix} \xi \right\}$

• Recall hybrid scheme where $x = [x_p \ x_c \ x_{pd}]^T$

$$\begin{aligned} \dot{x}_{p} &= A_{p}x_{p} + A_{pd}x_{pd} + B_{p}C_{c}x_{c} \\ \dot{x}_{c} &= A_{c}x_{c} + B_{c}C_{p}x_{p} \\ x_{p}^{+} &= x_{p} \\ x_{c}^{+} &= K_{p}x_{p} \end{aligned} \right\} \qquad x \in \mathcal{D}$$

• Interpretation: if $x \in \mathcal{D}$, jumps ensure $x_c^+ = K_p x_p$ (i.e., back to the "good" z dynamics: $\dot{z} = (A_p + B_p C_c K_p)z + A_{pd} z_{d_m}$ d Zd L2S Paris, 20-22 November 2012 16 /

Idea behind proof of (hybrid) global exponential stability

• Recall definition of flow C and jump D sets:

$$\mathcal{C} = \left\{ \begin{aligned} \xi' \mathsf{He} \begin{bmatrix} P_p A_{\mathcal{K}} + Q/2 & P_p A_{pd} & P_p B_p C_c \\ 0 & -Q/2 & 0 \\ 0 & 0 & \epsilon_c I \end{aligned} \right\} \\ \mathcal{D} = \overline{(\mathbb{R}^n \times \mathbb{R}^{n_c} \times \mathbb{R}^n) \setminus \mathcal{C}} \end{aligned}$$

• Consider the Lyapunov-Krasovskii functional (with suitable $\lambda > 0$):

$$V(x_t) = x'_{\rho} P_{\rho} x_{\rho} + \int_{t-\theta}^{t} x'_{\rho}(\tau) Q x_{\rho}(\tau) d\tau + \lambda (x_c - K_{\rho} x_{\rho})' (x_c - K_{\rho} x_{\rho})$$

• During **flows**, since $x \in C$, from Assumption KL (for small $\lambda > 0$):

$$\dot{V}(x_t) \leq -\epsilon |x|^2$$
, for some $\epsilon > 0$

• Across jumps, since $x_p^+ = x_p$, $x_c^+ = K_p x_p$, we get from the blue guy):

$$V(x_t^+) - V(x_t) \leq 0$$

• Stability proof uses Hybrid Lyapuonv Krasovskii theorem (next slide) L2S Paris, 20-22 November 2012 17 /

Lyapunov-Krasovskii thm for a class of hybrid systems

- For a state $x \in \mathbb{R}^n$, |x| denotes the Euclidean norm of x and $\|x_t\|_{ heta} := \max_{s \in [0,\theta]} |x(t-s)|$
- Theorem LK Assume that there exists a functional $V(x_t)$, class \mathcal{K}_{∞} functions α_1 , α_2 and a positive definite function ρ such that

$$egin{aligned} lpha_1(|x|) &\leq V(x_t) &\leq lpha_2(\|x\|_{ heta}) \ \dot{V}(x_t) &\leq -
ho(|x|), \quad orall x \in \mathcal{C} \ V(x_t^+) - V(x_t) &\leq 0, \quad orall x \in \mathcal{D} \end{aligned}$$

and assume that the solutions exhibit *persistent flow*. *Then* the origin of the hybrid time-delay system is **GAS**.

- Alternative formulations appeared in [Banos et al. 2009, Guo et al. 2012]
- Exponential stability holds for homogeneous dynamics

Numerical example: problem data

• The plant is defined by the following data

$$egin{aligned} \mathcal{A}_{m{
ho}} &= \left[egin{aligned} -2 & 0 \ 0 & -0.9 \end{array}
ight], \ \mathcal{A}_{m{
ho}d} &= \left[egin{aligned} -1 & 0 \ -1 & -1 \end{array}
ight], \ \mathcal{B}_{m{
ho}} &= \left[egin{aligned} 1 \ 1 \end{array}
ight], \ \mathcal{C}_{m{
ho}} &= \left[egin{aligned} 1 & 1 \end{array}
ight], \end{aligned}$$

The controller is defined by the following data

$$A_{c} = \left[\begin{array}{cc} -1 & 0 \\ 1 & 0 \end{array} \right], \ B_{c} = \left[\begin{array}{cc} 1 \\ 0 \end{array} \right], \ C_{c} = \left[\begin{array}{cc} 0 & 1 \end{array} \right]$$

- The continuous-time closed-loop system with no delay is exponentially stable with θ = 0.
- The continuous-time closed-loop system with delay system is **unstable** for $\theta > 1.6$

Numerical example: selection of the reset parameters

Plot of the maximized ε_p versus the bound κ_m imposed on K_p. Three simulations cases (*).

• Need K_p sufficiently large to ensure $\epsilon_p > 0$, namely GAS of the origin of the hybrid closed loop ST & LZ (LAAS-CNRS) Paris 2012 Paris 2012 • Need K_p sufficiently large to ensure $\epsilon_p > 0$, namely GAS of the origin of $\epsilon_p > 0$, namely G

Example: Plant state response with $\theta = 2$

Example: Controller state response with $\theta = 2$

Concluding Remarks

• Summary:

- This work combines concepts from the recent framework for hybrid dynamical systems with ideas from time-delay systems
- Use of hybrid loops (controller jumps) allows to recover stability which may be destroyed by time delay
- A hybrid Lyapunov Krasovskii theorem is instrumental for this goal
- Academic example illustrated the proposed approach
- Perspectives:
 - Extend to nonlinear systems (using Lyapunov)
 - Determine delay-dependent compensation schemes using Lyapunov Razumikin approach
